I understand you very well. In fact, several members of the aranym team have tried to write loudly here that aranym is not an atari clone. Unfortunately the confusion still survives in this thread but it's not their fault. Though it might be my own fault as I used the "fastest TOS clone" headline on atari.org when I announced 0.6.6. But I already tried to correct it and wrote there that aranym is not a clone. Still not enough to calm this thread down :-)

BTW, while it's not a clone we still believe it's part of the Atari/TOS platform. Some of us even believe that it's the future of our platform.

> Simple as that. I might even test it,

Please note that we don't force anyone to convert to the aranym machine. We just wanted to let you all know that there's a way out of the lack of new, powerful, TOS compatible hardware.

We understand that this way is not for everybody - I myself, being a m68k assembler fan, had some hard time when I was thinking about upgrading my Falcon030/Afterburner040@40MHz with Nova graphics and 68 MB of RAM, all in a huge tower (note that I already spent $$$ for the real toy), to something that was looking dangerously similarly to an emulator.

I thought for myself: "what sense does it make to run Devpac and develop something in m68k assembler when the resulting program will actually run on an emulated CPU? Similarly for GCC - why would I program inside of the `emulator' when I could easily work outside, in the native linux?". But then I realized it:

- with aranym, atari software developers get more speed, better graphics and more memory - that in turn will allow them to write Atari software more easily and quickly (ever tried to compile own FreeMiNT kernel or MiNTlib? Even small aMAIL took 15 minutes to compile on FX-Falcon, IIRC). At the same time they will run native m68k software in native TOS/MiNT environment. That makes it easier to debug the written soft and encourages the developers to live with the platform.

- Atari users get the power needed for running latest FreeMiNT OS, X11 server and other goodies from the free software world. They also get enough power for running games or demos we never had before (Quake :). That's a huge reason to not leave the Atari platform.

And these two things work together: more active developers => more new software => more happy users => Atari/TOS platform survives. And the other way as well: more demanding users => more developers => more software. And also: more powerful software => better chance for new Atari-like hardware (ACP). In my opinion it's simply a Good Thing to develop and support Aranym as it IMHO helps the whole platform to survive.

BTW, my thoughts about aranym being an `emulator' were two years old. At that time there was nothing but plans. Since then we have made a lot of work. Now we have a real product, and we have made sure it's not YAE (yeat another emulator). But that's another story...

> but I cannot as I would need a MAC binary.

That's just a very minor problem. Aranym can be compiled on Mac OS X directly and Wim already promised to send me a binary package for Mac OS X.

I have a Matrix M128. It's a monochrome card capable of 1280x960, but it
doesn't work with my multisync so I assume it needs an ECL monitor.

>perform a certain action (calculation etc.) in a fixed time. For example

VDIBench has always worked like that, for exactly the reasons you
mention. I seem to recall Kronos working like that too, but I'm not
sure about that.

Another problem with most benchmarks is that they insist on performing
some kind of 'average performance' computation. Not only is this often
calculated in very dubious ways, it also often combines data from
completely unrelated tests (many of which are often completely
irrelevant to anything anyone would ever do on a computer).
The end result really says nothing at all, which is quite unfortunate
since that is the only number most people will ever mention...

Hi

I thought I'd take some time out of copying disks for a little leisure and play pinball dreams, but it looks like someone has spilt coke all over the disks:((I've done what i could to retrieve the data, but the disks are to far damaged for me to even attempt a recovery.

I'd be grateful if someone could help me with the files, as this is/was hard to get hold of.

thanx in advance:))

Yes.

> And what is it ECL?

The video output is not compatible with VGA. The signal level on VGA is 0
- 0.7v (IIRC), ECL is -5v - 0v. The old 19" mono-monitors for the TT and
the Viking-card for the Mega where ECL-monitors, I'd assume these will
work with this card.

A few months ago I won a ZX Spectrum +3 on eBay from SIMON SHERRING.
The complete description was in UPPERCASE.

Of course he disappeared after I sent him the money.
I guess I was stupid not understanding what type of guy this was.

Never heard or received anything from him since.

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware; AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video2.zip (151Kb).

The AES version does the same work as the VDI one, except it displays in
a window.

I added MVDI support to the XBIOS version. If you have a Milan, test it,
it should give you info about available video modes. I will make a more
complete test program the next time.
Warning: it may crash your machine.

Thanks to people that tested the previous programs.

Got the ISA EtherNEC Ethernet to ROM port adaptor from Lyndon Amsdon today. Works perfectly with STinG on my Stacy with Geneva.

On the TT however it does not work at all. My STinG setup is in good working order and I have tried both ENEC.STX and ENEC3.STX without success.

On a very basic TOS 3.6 setup with nothing except what is needed for STinG the .STX manage to read the MAC addres bot nothing goes out. The LED flickers but all packages gets dropped.

The very same setup but with Magic 6.20 results in the .STX even can't read the MAC addres but pops up with FE, FE, FE, etc. This is if I start without any STING.PRT file.

My present conclusion is that the STinG drivers by Redelberger does not work on a TT. Anyone who have got it working?

I'm using the latest drivers from his homepage. And, I did copy ROUTE.TAB from the working Stacy TOS 1.4 setup just to by sure.

>CD that I had made into my STe and it did not come up. The CD drive in the STe
>just has a read-only CD drive.

Well, the other floppies I was talking about are for a MIDI
keyboard/sampler (Ensoniq EPS). They are in a completely different
format than normal Atari floppies. But the software called EPS Wizard
can read the Ensoniq disk format, and save it to the Atari's hard
drive (each EPS floppy can be saved as a file that can later be
converted back into an EPS floppy). After doing this with all of
them, I will use CD ISO to burn a CD of all of them.

>The best way is to think about it and start. Once you start, the rest is easy.
>I have some CD projects sitting right in front of me and typing this message
>is putting me in the right frame of mind.

Yeah, I just need to dive right in and get to work.

Source record: 31363

I recently visited a friend in Rochester, New York (USA).

While there, we visited a small music store with a very large inventory of used and older music gear. While exploring the keyboard room, I noticed the familiar box of an Atari Falcon. And then just below it, another one.

The guy working there informed me that they had recently found them in their basement - 7 in total, in various configurations.

They aren't necessarily bargains though. The sales guy told me that they've sold a couple on eBay recently, and got around 500 US dollars for them. However, I get the feeling they would accept a lower offer.

The place is called "House Of Guitars". I don't have an address, but you should be able to find it with a web search if anyone is interested.

>independant outs of the Line Audio FAD? Thanks for any advice!
>Wayne Martz

Well, in case you didn't get my e-mail on this, it's set in the mixer BUS section:

The FA-8 (and the JAM 8 Out) don't need any special drivers to work with Cubase Audio. It is a little confusing, but it will work if you set the Mixer output BUS correctly.

You will find BUS selectors in various places in Cubase Audio:

- For each channel in all mixer maps
- For the effects outputs in mixer maps
- AUX sends in mixer maps
- In the HARDWARE SETUP where you can assign the Falcon's analog output to any BUS.

BUS 1 = FA-8 outputs 1 & 2
BUS 2 = FA-8 outputs 3 & 4
BUS 3 = FA-8 outputs 5 & 6
BUS 4 = FA-8 outputs 7 & 8

So, for example, you can send a channel to one output only by panning it either left or right. So if route a channel to BUS 4 and pan it fully right, it will appear on FA-8 output 8. If it were panned fully left, it would appear on output 7.

I hope that helps. It took me a while to figure it out when I got my JAM 8 Out!

I have another experience. I have tried EtherNEC on 3 TTs. It works perfectly on two of them (on one I must change bad fuse for 5V Ucc for ROM port) but on last TT I cannot start the connection. The MiNT driver starts ok. The MAC address is ok. I can do ifconfig and route without problems but it is all. The next comunication doesn't work. And I don't know why, because the same hardware works nice on my Falcon.

Hi J-E,

do you by any chance have software for this card (drivers etc)?
I was asked for this by some german guy who bought one (fair chance he
doesn't know about this being for an ECL monitor), but it would be
handy to have them available on my Matrix support site as well.

3111. Uploading Large Files

Newsgroup: comp.sys.atari.st
Date: 2002-10-26 13:23:14 UTC
From: "Edward S. Baiz Jr." <edbaizjr@attbi.com>
Message-ID: <3dba41d662d0d4@attbi.com>
Source record: 31371

Hello all,

I have recently run into alittle problem whne I try to upload large files (greater than 3meg). The Hades locks up and gives me a message (in German) about a system error and than I should use the program Addmem.I am doing this under Magic/MagicNet. It never used to happpen, but now it is. I have gotten things to work by inreasing the buffer in Magic to 99999. I know it is a memory problem, but cannot find the source (yet). Anyone experience this type of thing before or now a quick solution? I am still experimenting. I am going to try it under Mintnet and see what happens.

3116. XaAES v0.960

Newsgroup: comp.sys.atari.st
Date: 2002-10-26 21:00:17 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <3DBB0184.3D75BBA@chello.nl>
Source record: 31376

LS
There is a new version available on my homepage (in sig)

1
Redraw optimization for newly topped windows. If the window was already
completely visible, no redraw message is sent.

2
Implemented mouse wheel support.

To be able to use the mouse wheels under XaAES, your VDI must support
the new VDI function 134; vex_wheel_v.
If you run a MILAN with the latest release TOS, you've got it.

Otherwise you can find it on:
http://www.ccac.rwth-aachen.de/~michaels/milan.php

You can activate the use of mouse wheels in XaAES by replacing
vmoose.xdd by whlmoose.xdd.
If necessary change vmoose.xdd to vmoose.xd
and whlmoose.xd to whlmoose.xdd

XaAES converts wheel action to corresponding WM_ARROWED
messages. So there is no need to change applications.

The messages are sent to the top window, and only if this window has
the appropppriate arrow widgets.

More functionality for wheel aware applications and any configurable
options will be implemented in future releases.

3
debug_lines is now a long.

4
Small AES function that do not need semaphores
are called direct. Occasional speed improvements.

5
Progdefs can spoil the intout array. (vmg_tt.prg).
Made sure that intout is filled out AFTER any object drawing.

6
Fixed a bug in F_TEXT, G_FTEXT objects:
If 3D object, do not write a black rectangle for selection.
This corrects at least MINTSETTER.

7
Implemented use of home directory for shell_find.
Activated by the command usehome in xa_setup.scl.

If activated and a environment variable named HOME exists,
shell_find will look in the HOME directory after looking
in the clients homepath and before looking in the PATH directory list.

This applies also to XaAES itself, so in a multiuser environment each
user can have its own XaAES scl files and hence its own setup.

8
Fixed a bug in wind_close:
The rectangle list was not removed.
This fixes the behaviour in the JayGrpII program.

9
When the alert pipe reports a alert and the screen was locked, the alert
was flagged as pending. Alas the pending alert was never displayed.
You might have heard a ping in stead.
It was in the system alert window, so it wasnt lost.
Now any pending alert is displeyed as soon as the screen is unlocked.

10
In colour the title of windows without the move attribute is displayed
without 3D effects.

11
Fixed a bug in popups.
In stead of moving the popup inside the visible screen, it was shortened
and made scrolling.
Popups are now only made scrolling when they are larger than the desktop
workarea height.

I was told a while ago, well to be honest I posted an article wanting
the missing abacus volumes for my collection, that there are 14 volumes!
The first being number '0'..

I am now just missing the '0' and the 6th volume.

Also have you noticed that the volumes arent the same size on the
bookshelf. I have also got a few of the hardback 'databecker/1st
publishing' manuals and they arent the same size (in height) either, but
the ones i have in the paperback 'databecker/first publishing' are...
weird:P

If there's anyone in the UK that has got the 2 volumes that i'm after,
i'd be grateful:))

From: northstar2010@_del_ete_yahoo.no (Hallvard Tangeraas)
Date: Wed, 23 Oct 2002 16:24:57 GMT

Hi Hallvard,

>I've been searching all over the site, and all I can find are free
>upgrades from version 6.something, or the full MacOS X version. There's
>nothing about upgrades from my (really) old version.
>I'm pretty sure this is possible though.
>Anyone know of any place I can get it and how much it'll cost me?

There are two options at the moment:
1 - Order the German 6.2 upgrade from ASH ==> 39 EURO
2 - Order the English 6.01 upgrade from Atari Workshop ==> 59 UKP

Since the German version is lower priced and newer (6.01 is nearly 5
years old) it seems obvious to me which one to choose. DDP has finished
the English translation for MagiCMac 6.2 a while ago but if it's going to
be released remains to be seen. Currently we're waiting on permission
from ASH to put the translated configuration program on the DDP website,
with this translation almost 95% of the German text strings are replaced.

You can order the upgrade from the ASH website, click on "preisliste" or
"bestellen" (I forgot the formulation they use). If you own more then two
ASH apps then you are a "Power user" and can get the upgrade for a lower
price. You can ask to have the update send to you by email, on disks or on
CD....
For additional info mailto:oliver_buchman@ash-sww.net , Oliver understands
English but will most likely reply to you in German, if that's a problem,
you now where to find me ;-)

>I might upgrade to MacOS 9.2 though as a more experienced Mac user than
>me has recommended this, and it's apparently free.

Unless you revert to using a hack this isn't possible. OS 9.1 was the last
OS supported by Apple for the PM 9500, OS 9.2 won't install on a PM 9500.

Cheers from Belgium
Dennis

>There's only mention of a free upgrade from more recent versions at the

I think you've answered your own question :-(

If and when you decide to upgrade I (DDP Translations) have an English
version of the MagiCMac configuration program, not on the web site.

Cheers

Derryck

Hello,

When I was setting it up on my Hades, I emailed the author many times before he finally answered me. When he did, he said he had a newer version that was being tested and wondered if I wanted to test it. Of course I said yes, but he never got back to me. I have since emailed him many times with no answer. He said he was busy, so I just keep emailing him. The MagicNet website is still up, so I guess things are still a go. I need the newer version as I have a newer driver for my Ethernet Card from Osz that works fine under Mintnet, but crashes my Hades under MagicNet.

Well I think I have solved my problem. I put the program
addmem.prg in my auto folder and things seem to be working. The
thing that stumps me is that things were fine before and I have
not added anything to my system. I will see just how things go. I
tried it out again today and it worked.

Whitch memory board do you have?

Some boards needs fast page edo 16Mb / PS2, other boards needs parity
ram modules. Falcon can be expand with memory boards from wizztronics,
h&n, wb-systemtechnik, centek and some more.

Huh?

Since the memory controller in the falcon does not handle parity, installing
parity SIMMs seems like a waste of money - it can even hurt stability if the
board leaves the parity data lines floating.

Anyone,
I have a memory board installed on my Falcon030 that
takes just 1 16 meg simm the simm is located on the
underneath side of the RAM board. What kind of memory
am I looking for to replace a bad simm??? I have
place called JDR that I can order FPM or EDO here is
what I can get listed below:

72 pin FPM simms:
16MB Non-Parity 4Mx32, 60ns
16MB Parity 4Mx36, 60ns

30 pin FPM simms:
16MB Parity 16Mx9, 60ns, 9 chip

72 pin EDO simms:
16MB Non-Parity 4Mx32, 60ns

These are all of the 16 meg simms besides a 168 pin
which I am sure is not compatible with my Falcon030.
Any help that anyone could provide me with information
on the correct RAM to use on this computer would be
greatly appreciated. Thanks in advance!!!

Carey Christenson

3132. [Magic 6.01] Path Overflow?

Newsgroup: comp.sys.atari.st
Date: 2002-10-27 18:32:28 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <MeWu9.22626$Be4.20122@news.bellsouth.net>
Source record: 31391

Using Magic 6.01 with the included MAGIX DESK, on a Falcon I get a path overflow error when getting disk info from my IDE drive's C partition. Another time I get this 'path overflow' message is when I back up this partition to another hard disk by dragging the partition's icon to the icon of my back-up SCSI drive.

The partition is a 1gig BGM with the regular TOS FAT (no long file names). Disk driver is HDDriver 7.93.

Despite the disk overflow message...things seem to work fine. Running a check on the partition with both Diamond Edge, and HDOptomizer report that things are fine.

What causes this message, and what need I do to fix it?

Thanks,
Brian

I only see 12 volumes or did I miss something?
There never was a volume #7?

>because the same hardware works nice on my Falcon.

I have now made some further tests. Note that I have only tested the
STinG versions sofar. Guess I will have to try MagicNet as well...

Stacy (ST TOS 1.4) and Mega STe (TOS 2.6) running Geneva both works
perfect with the ENEC.STX .

Tested both ENEC.STX and ENEC3.STX on my three TT:s and none of them
work. With Geneva the MAC address is read but with Magic 6 not.

Just tried to change the program load flags on ENEC3.STX to load and
allocate from TT RAM and with this setting this TT now reads the MAC
address under Magic6 too!

When I try to Ping my main router data goes out on the Ethernet line
(lights flicker on both ends) but they seem garbled as nothing comes
back. Double checked my ROUTE.TAB by using the other parallel-to-Ethernet
adaptor.

Also tested HT2ENEC.TOS and it will read the MAC address on the TT under
Geneva with an output as follows:
```
-----------
Test EtherNE with NE card but without any STing, MagiCNEt, MINTNet
Software (C)2002 Dr. Thomas Redelberger
Interrupt Status register after Reset (should read $80): $c0

Reading the NE PROM.
The first 12 bytes are the 6 byte MAC address
Each byte is doubled up (this is normal):
0000c0c0
dfdfc4c4
45456565
20202020
```

```
20202020
20202020
20202020
42424242
Press any Key
----------

Everything is fine except for the interrupt status register?

Now under Magic 6.20 and STinG not installed:
----------
Test EtherNE with NE card but without any STing, MagiCNEt, MINTNet
Software (C)2002 Dr. Thomas Redelberger
Interrupt Status register after Reset (should read $80): $80

Reading the NE PROM.
The first 12 bytes are the 6 byte MAC address
Each byte is doubled up (this is normal):
00000000
00000000
00000000
00000000
00000000
00000000
00000000
00000000
Press any Key
----------

Here the Interrupt register is ok ($80) but no MAC address. Strange...

I really have a feeling there are some timing problems. A quick look in
the source code HT2ENE.S showed these lines:

move 10000,d0 ; wait 2ms
.t1 dbra d0,.t1

That must give very different results on different hardware.

Has anyone got this Ethernet adaptor running with STinG on a TT??

Hey everyone, I'm looking for a TT030, Falcon, or a clone to replace my passed Mega ST4. I would prefer the TT over the Falcon (I think, if anyone disagrees feel free to tell me why). I can pay about to about $300.

Minimum specs: 32MHz (TT), 4MB RAM (2/4 TT, pref with SIMM board), 200MB+ HD, VGA Adaptor (Falcon).

Please email or reply here if you have something your not using. I'm located in Massachusetts, US.

Not sure of intent of question.

If its what am I using then currently using STing, but I think I have had
MintNet working (will check it out if its important).

It its what do the test programs need then its nothing. The test programs
access the card directly, and do not require an IP Stack.

Under standard TOS or Magic?

Strangely I have three TT:s here and none seem to work properly with the
adaptor. Two of them are of the older type with metal shieldings. One
with original TOS 3.1 and only 4 MB ST RAM. The other upgraded to TOS 3.6
and 36 MB RAM (4+32), some harddisks and CDROM.

The third TT is from March 1991 and has been downgraded to TOS 3.1 . All
three have working cartridge ports.

Possibly.

If you remove the cover (7 screws) and the first section of shielding
(about 10 screws) you will see the memory board a little toward the
keyboard and right of center. You should be able to read the SIMM
without much trouble. What does it say?

Hello to all Atarians,

I just listed a Happy Computers Atari ST Discovery Cartridges for sale on eBay, it's worked great for me... Auction includes the cart, cable, and utilities disk.... Also included (but not mentioned on ebay) is a custom disk I put together which loads the cart prg. into a ramdisk and allows you to edit/customize the archiving parameters... Many customized routines are included for specific ST prgs. that were not on the orig. disk.. You can ALSO archive atari 8-bit prgs. (if you have a 5.25 drive attached to your ST), AND PC and MAC floppies!!

see listing at:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2065413719&rd=1

OK, I have a TT (2ST/4TT/200MB HD) and a Falcon (4/80) that I can get for around the same price ($300-$250 respectivly). Which one is better for running newer Atari software? I know each has tradeoffs (TT has faster processor and more expandability), Falcon has DSP. What the the falcon's highest native resolution? Help! Need more info. The best ST I've ever used is a Mega ST4

Chris

Falcon can do beyond 1000x600 but this resolutions are avialible only when
running a software enchancer (no hardware needed). I do not remember the
maximal value. Note that bigger resolutions eat speed. Note also that in TC
the maximum resolution is smaller.

Without screen enchancing software the max you can get is 640x480.

The TT is really nice, but I would only choose it for development if it
was me, otherwise the falcon is a better choice in my opinion.

The falcon is broader, games, music, graphics etc.
The slower CPU in the falcon can be upped to match (actually even faster
than TT) if you are concerned about the cpu speed (ct2 boards etc).
TT natively can take more RAM than stock falcon which can be good for some
things.
All depends on what you want to do really and if you want to put a little
extra money to be comfortable with the machine you would choose to get.

The TT is faster and is easier to add a graphics card to. The Falcon has superior sound, and will be faster if the CT60 comes out and works as advertised. The Falcon's highest native preset resolution is 640x480x256 @ 60 Hz, but an auto folder program (Videlity) exists that allows for 800x600x256 @53 Hz (a bit hard on the eyes, if you ask me). With a video card, much higher is possible, of course.

My personal opinion is that the Falcon is the superior computer for most home users unless your TT happens to have a nice 1280x960x2 ECL monitor.

Both EDO and FPM 72 pins modules work fine (I tried both).

3156. Cab 2.8 and Error #69

Newsgroup: comp.sys.atari.st
Date: 2002-10-29 22:50:10 UTC
From: Neil Chester <neil@adel6.freeserve.co.uk>
Message-ID: <1035928742-994446AEicMi@adel6.freeserve.co.uk>
Source record: 31314

I am sure this has come up before on this newsgroup but I can't remember what the recommendations were!

I am using CAB 2.8 along with Iconnect 1.8 and the officially supplied CAB.OVL, on a CT2B system using MagiX 6.20.

1) Whilst using CAB the dreaded "68000 Exception (Fehler #-69)" occurs now at least 7 out of 10 online sessions, either within a couple of minutes of starting or anytime else usually to cause maximum inconvenience(!). Some times I can re-start CAB and be lucky but usually it falls over within 5 minutes again...

2) I have tried MAGTOROM in the Auto folder but I get two bombs when it is loaded, so I assume that it crashes on start up!?! Is it supposed to work with a CT2B? In Alt-RAM or ST-Ram? MAGXB032 may also be faulty?

3) Also another annoying feature of CAB these days is that clicking links to websites or typing in web addresses manually usually results in an immediate "File error" on a grey page. And yet when I click again on the link CAB displays the website, it seems that it is admitting failure a bit too quickly (not going to Net first?)!

I have tried clearing/extending the CAB cache to 30Mb. Also not having Emailer loaded in the same session but no luck....

Any suggestions would be welcome as usual!

Regards

Neil Chester

Source record: 31316

Christopher,
Depends on what you want to do with your Atari Computer???? I can tell you right now that the Falcon will beat any Atari computer at Audio apps. Apps like Aniplayer or Falcamp just to name a few. Converting MP3's to wav's with Aniplayer is much faster on the Falcon because of the DSP, which Aniplayer uses. Yes, the TT030 has a faster processor but this computer is built more for desktop publishing. As far as expandibility I am unsure on the TT030 what is available. But the Falcon will soon have the CT60 (which I am in line to get) which will take the processing power up to a 72 mhz. 060 which will make the Falcon the most powerful Atari computer available. Not to mention NATURE is working with R. Czuba on making a FULLY COMPATIBLE graphic card which will plug into the CT60 which will give us 1600x1200 resolution in 32 bit color all with 32 megs of DDR SDRAM, they claim 99.9 percent compatibility with Atari related software. I have the ECLIPSE graphic card adapter with an ATI Rage with 4 megs of VRAM and I dont get know where near 99.9 percent Atari software compatibility. At the moment a stock Falcon is capable of 640x480 in 256 colors which is adequate not sure about the screen enhancement software someone else spoke of. But if there is such a thing I would agree that it would take alot more processing time to run such a program. But go with either the TT030 or the Falcon030 but I would steer clear of the ST's unless they were considerably cheaper. If you need anymore information let me know!!!! Thanks and long live all Atari computer everywhere!!!!!!!!!!!

Thanks,

Carey Christenson

Try another overlay. Olivier Booklage's one works with STInG, STiK and
IConnect.

Also consider installing MagxNet. With that, GlueSTiK and the IConnect
gateway (you'll have to email Vassilis for the latter) you'll have all
bases covered and it is also much faster than IConnect.

>2) I have tried MAGTOROM in the Auto folder but I get two bombs when it
>is loaded, so I assume that it crashes on start up!?! Is it supposed to
>work with a CT2B? In Alt-RAM or ST-Ram? MAGXB032 may also be faulty?

I only use the latter, which I assume performs more or less the same task,
preventing the MagiC kernal from being overwritten.

>3) Also another annoying feature of CAB these days is that clicking links
>to websites or typing in web addresses manually usually results in an
>immediate "File error" on a grey page. And yet when I click again on the

I've had that happen sometimes, but I click on the "Refresh" button FWIW.

Try the overlay I suggested.

Cheers

Derryck

3161. November Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2002-10-30 12:39:48 UTC
From: Francois LE COAT <lecoat@lutece.net>
Message-ID: <3DBFD314.8040207@lutece.net>
Source record: 31321

Hi,

My software "Eureka" is updated and released on my WEB site.
It's a "2D Graph Describer" and a "3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka211.zip
That is the Complete Common Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Is Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny043.zip
Is the OpenGL Extension (requires previous package)

I wish you big fun with all this STuff.

Regards,

Hi All

It's not very often i'll stick my nose in with info in items for sale or
for auction, but I highly recommend these cartridges.

I will be supporting the discovery carts on my 'www.atarian.com' web
site, but am working on both last pd and asx sites atm:)

For those that dont know, these cartridges can back up ANY disk you
stick in your Atari drive. It DOESN'T need a TWO drive system, there are
a very small number of internal drives that wont work with these carts,
and i mean rare.

You can archive disks to a file, and that also doesnt depend on machine
memory.

The one on auction looks like the basic one, but a pass through port can
be added easily, and files usually come on disk listing parts that you
could add yourself for the following. Clock, ability to have an
additional TWO floppy drives (you will need a pass through drive for
that) and also has space for eproms/sockets to be used as a normal
cartridge type application, although the design was for the Apple Mac
chip sets.

I have tried it on all forms of ST, but not yet got it to work on a Mega
STE. BUT have been told it WILL work running the mega STE at 8mhz
instead of 16mhz.

Come to think of it, I've not tried (never needed to really) using it on
a HD disk, although I;ve had NO problems reading a double density drive
in a HD drive running on an STE with TOS 2.06..

Steve,

Yes you're correct, this is the "basic option 0" Discovery Cartridge,
BUT, as you've pointed out again, IT WILL COPY virtually all Atari ST,
PC, Mac, and even Amiga floppies, including Atari 8-bit protected
disks (with a proper 5.25 drive connected to the ST).... I don't know
however if it will copy HD (1.2 meg 5.25's or 1.44 meg 3.5's) disks,
because I don't have a mega st with such drives and don't know if
anyone else has done so... Do you know also if the DC works with
the Falcon??

>anyone else has done so... Do you know also if the DC works with
>the Falcon??
>
>GF

I'll give it a try when i get z chance. But i think it may fail as the
Falcon has a 16meg clock speed.. Be neat if it worked:)

And then my brain clicked on..... the falcon doesnt have an external
floppy connector, so would have to have an adaptor or something so that
the lines can bypass the fdc...

I have not used the DP0801 units, but I do have two of Cartridge Port NE2000
adaptors running under STING. Transfering files to and from my PC running
Windows/2000 is not at all simple. I tried several combinations of software
before I found one that worked. In the end I ran an FTP server (I think
there is only one) on the ATARI and used one of the GUI FTP clients on the
PC. I did try several PC clients before I found one that was stable when
connected to the Atari. The usual "free" ones did not like the file listings
from the Atari and fell over.

Anyone,
I found this nice program that is a START button for
in the lower left hand corner. Problem all DOCS are
in DUTCH or GERMAN. So I do not know if it needs
registered or how to set it up. The name of the
program is select21. Anyone currently use this
program???? Any help would be greatly appreciated.

Thanks,
Carey Christenson

Strange, I can't get my NE2000 adaptor working with my TT with STinG or
MagicNet but have no problems at all with ftp to my Win pc :-(

I use FTP_SERV under STinG (and nullmodem from this TT to another TT with
the parallel port to Ethernet adaptor and the free WS_FTP client on the
pc. Works great!

> > suceeded in transfering some files.

I have one of these units working with STing on a Falcon CT2b, MagiC 6.01,
HDDriver 7.93. It is connected to a Draytek USB2200 ADSL switcher.
Also on this switcher is a Windows XP Home workstation.
I also had the same setup working with Windows 98 before the XP upgrade.

This set-up puts my Falcon on the net at broadband speeds! Thanks to the ADSL
switcher...the PC does not have to be on for the Falcon to use the ADSL
connection.

I've had no problems using ftp to move files across the lan or the internet.
I've run ftp servers both on the Falcon and on the Windows box successfully.
FTPserve for STing works fine.
The server I've used successfully on the PC end is called WFTPD.
If you have trouble with ftp on either end, do be sure to try with both the
server and client in passive ftp mode before you give up. I've found that some
clients on the Atari end only work in passive mode....

There are two things NOT to forget on your windows machine!

1. Make sure you register the arp with windows, otherwise your Dynalink gets
ignored! In my case I made a batch file that auto starts (just make a shortcut
of the batch file and drag it into your startup folder) with the following line:

arp.exe -s 192.168.1.22 00-80-19-10-C4-4B

arp.exe = launches arp.exe
-s = static connection
192.168.1.22 = ip address assigned to the Dynalink on my lan.
00-80-19-10-C4-4B = Dynalink's physical (mac) address.

2. If you have the XP firewall enabled, or other firewalls installed, be sure
to add the Dynalink's ip-address to your trusted list.

Final notes:
I've had a very stable ethernet connection for weeks now on a Falcon CT2b in
trubo mode running MagiC 6.01, HDDriver 7.93 (DMA off). I do have quite a long
and currently happy (knock on wood) SCSI chain (1 SCSI 2 HD, 1 UWSCSI 3 HD, 2
CD-ROM units, the Dynalink, and a Mustek scanner).

Everything in my STing setup EXCEPT for the scsilnk.stx is set to run in TT RAM.

Happy Livin'!
Brian

Greetings,

I have two ST's that I haven't been using for the last couple of weeks, since I bought a workstation synth, so I'd like to pass these wonderful machines on to someone else (rather than just letting them sit and collect dust).
The plastic on one of them is a little yellowed but is in perfect working order. The second one looks like the day it came out of the box.
they include the manuals and system disk, mouse etc. I also have one sm124 black and white monitor and one sc1224 color monitor.

$50 for the "yellowed" unit with the black and white monitor.
$75 for the perfect unit with the color monitor or some sort of combination thereof. Make me an offer before I stick them up on ebay.

Hey all,

under MagiC 6.1 Porthos doesn't work for me either. I start porthos fine
and go to load the manual PDF available on the same page as the demo and it
draws a white screen and then proceeds to bomb with error -69. Oops ;-)

Hi,

many years ago I heard from someone on NeST that he patched the game SimCity to run in an extended Falcon resolutions (currently it requires ST-Low, i.e. 320x200 in 16 colors, but the game would look way better in say 640x480). The game itself seems to be fully GEM conformant so it should not be impossible to do that.

Doesn't someone of you have the patched version by a chance? Or would someone be willing to look into it? :-)

Petr

Hi,

my 5 years old son loves to play the demo version of Willie's Adventures. Actually he's been playing it for last 2.5 years so he's pretty good at it. Frankly, he can win the first level even with closed eyes... I tried to convince the New Beat Development to release something after 5.5 years of "development" but they don't seem to be inclinable to do that.

So I am searching for another free game that he could play for a while. I just need to get it running on my Afterburner040 (i.e. a Falcon with MC68040). If you know about something please send me the URL. Thanks.

Petr

Hi, the trick is to use an original copy in stlow, with cache disabled, this is all fine as long as you only have 4 MB. You can use a Ram disk of 10 Meg if you have 14MB.

check that you've set arp on the Windows machine.
see arp.exe
An example of how to do this automatically...
make a text file called arp.bat on your PC that contains the following line:

arp.exe -s ip.addy.of.your.falcon mac-address-of-the-dynalink

Next, make a shortcut of this bat file and drag it to the windows start-up folder.

I'm assumeing this is a direct connection to your PC? No hub or switcher?

If you have a firewall running on your windows PC...make sure the Falcon's IP address is in your trusted/local zone.

Be sure the subnet address is correct.

Be sure that the gateway you have set in the STing ROUTE.TAB is correct. If you are wanting your ethernet port to be the default route, then you'll want this to be the last line in the ROUTE.TAB file (use a text editor to edit).

If your PC is called 192.168.0.1 on your lan, and your PC then connects to the internet, then that 'should' work as the gateway. Double check that your PC is indeed given said ip-address. I.E.
0.0.0.0 0.0.0.0 Ethernet0 192.168.0.1

You might also try with a simple default routing of:
0.0.0.0 0.0.0.0 Ethernet0 0.0.0.0

This one simple default routing is usually all one needs unless you're using more than one port with STing. You can still 'dial out' if needed, because the dialer always sets a default route to the modem port in use.

Finally, in the STing ports.cpx, be sure you've given the Falcon an ip-address.

A DNS server is important. If you get 'can't resolve host name' messages when using your PC as the DNS/gateway, then find out what your ISP's DNS server is, and enter that.

Hope this helps,
Brian

I have my Hades060 and an old imac on the lan.
Actually I did run cab once or twice and it worked.
The TT was on cable modem at that point.

That's a shame, they had made a very good job on this Rayman clone.

Cheers

Dans l'article <5gqbpa.mja.ln@127.0.0.1>, "Patrice Mandin"
<pmandin@caramail-nospam.com> a tapotï¿½ avec ses petits doigts:

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware; AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video3.zip (155Kb).

There are some bugfixes for the three programs.

The AES version does the same work as the VDI one, except it displays in
a window.

I added MVDI support to the XBIOS version. If you have a Milan, test it,
it should give you info about available video modes. I will make a more
complete test program the next time.
Warning: it may crash your machine.

Thanks to people that tested the previous programs.

You can record directly into Cubase Audio (or a free programm like VTRax http://www.chez.com/ricard/realisations/english/index.html) or WinRec. And apply effects with Studio Son (same link), Winrec or Squash. Cubase Audio has same simple effects too (yes, for audio). You can't record with Cubase Lite since it is Midi only.
What you need is a preamp/effectunit like Boss GT3/ or POD to get the guitarsound in.
If you want to record 44.1 or 48.1 hz (standards) you need something like the Cubase Audio Clock (comes with Cubase Audio) or the Soundpool FDI.

The Falcon is a great machine for recording without latency, but the lack of hardware and software makes it relatively expensive. It will save you money if you have a PC with a cheap soundcard. I have and still prefer the Falcon.

That is strange: at my TT it's all working accept
for some PDF which might be a little bit over the
head of the program..But then you can send the
file to the programmer who will se what can be
done about it..

I also tried it but as you I couldn't get it running. It looks like it has
a hardcoded screen size somewhere or something alike (perhaps small int
arithmetics - 320x200 is < 2^15 while 640x480 overflows...)

I didn't really spend much time on it. I just disabled the check for
ST-Low..

Hmhmhm, the point is that I don't want to run it in ST-Low! I want to run
it in much larger resolution simply because the game really needs it.

I recently got a cheap consumer Stand alone CD Recorder, and was pleased that it provides a 44.1 signal to the FDI. But in order to do digital transfers from CD recorder to FDI & Back, the FDI needs to comply to the iec958 audio standard. Anyone know what that is, and if the FDI can do that?
Thanks!
Wayne Martz

You can use the keyboard of an old broken/unused ST. It's very simple to change, even I can do it. ;)
There's no need to replace the rom-hardware, I think. I've got a software program which can do this easily. According to my information and own experience with a German Falcon, German Ataris have an English TOS also.
Mail me if you're interested in the program, it's been made for Falcon, but it could work on other Ataris.

It should. IEC 958 (aka DIN EN 60958) ist the spec for digital audio on
optical or coax, which is sometimes also called S/PDIF.

3207. How do I record using digital FDI in cubase audio.

Newsgroup: comp.sys.atari.st
Date: 2002-11-01 17:11:26 UTC
From: Rob <rob.jenkins2@btopenworld.com>
Message-ID: <f4d5sugm1mu1baae3eq5tef41redjhs4po@4ax.com>
Source record: 31265

Got a copy of cubase audio, disk and dongle only, no manual.
I've found bits of information regarding the differences between audio and cubase 3, but so far nothing on how to record.

I'm using a soundpool FDI, on coax input, and in the hardware setup, I can choose from A/D or FDI L or R and record at 44.1khz, only problem is, I don't know where to do the recording.

I tried hitting the record button whilst on track one on the arrange page, and I got a warning saying that I couldn't record to that drive, so I tried all the others (6gig in 8 partitions), but got the same message each time.

Could it just be my drive isnt fast enough, it's an IDE, though I do have a SCSI Zip I could try.

Thanks for any help.... Rob

Cubase Audio Falcon can only record to an external SCSI harddisc, Zip or Jazz. Although ZIP isn't fast enough to do 8 tracks (4 are measured). IDE's just don't work.
When Steinberg made CAF not all IDE's were fast enough to do HD recording, SCSI were. So they deliberatly ruled out IDE to avoid complaints that CAF wasn't up to the job.
Try to buy an external SCSI HD from 4 - 6 Gb, there not that expensive anymore.
A/D means you can record through the stereo minijack microphone input of the Falcon (not really cool), or you can record through the S/PDIF in, that is: when the instrument/ amp/ mixer has an S/PDIF output. Some people record through the digital ins and outs from DAT/Minidisc/ CD players, which is a better option than those damn minijacks.

Source record: 31268

Hi,

I'm having a strange problem with CAB lately, but I don't know when it started. Can't remember having problems in the past.

Here is what happens. If I try to start an external program that I have installed inside CAB to open for example MP3 (Aniplayer) or PDF (Porthos) files, I'm getting an Address Error or other error message. Also I'm error messages when I try to download links by using the right mouse button. I other words, many of the fun things give problems. But only when I use my Falcon in 256 color resolution. When I switch to 16 colors the problem disappears. When I switch to single TOS: also no problems anymore.

It doesn't make much sense to me. Any suggestions ?

I haven't tried the new version yet, but it *could* be a memory
problem, particularly if you have thumbnails generation switched
on. With my normal setup I had problems with blank pages, when I
had only 8 MB or my 14 MB available with the previous version. The
author told me that this is because the thumbnails have to be
converted from CMYK 4-colour to RGB 3-colour, which eats *a lot*
of memory!

I have 14 MB normal RAM + 32 MB FastRam on my CT2b Falcon. Should be
enough. The previous version worked fine.

From: Don Wolfe <donw@intergate.com>
Message-ID: <0zKw9.7023$8j1.289673@newsfeed.slurp.net>
Source record: 31274

To All,

My ISP has changed the logon configuration for the news groups. Their looking for my user-name as donw@intergate.com and Newsie sends only what is left of the @ sign.

Is there any work around for this, or is there any way to patch Newsie ??

Thanks, Donner.....

It's even worse and stranger: I'm not having these problems in 640*480*TC
(Centscreen mode) either. Only in 256 colors! And when I leave CAB
afterwards I can't start any program, including CAB itself. If I try to
I'm getting an "Illegal instruction" error message. I have to reboot to
get my machine working again. The only good thing is that my system
doesn't hang, and I can do that cleanly.

Have you tried to put "donw@intergate.com" in the NEWsie settings where
you probably have "donw" entered as your username or login name now ? I'm
just guessing, I haven't been using NEWSie since a long time anymore.

can someone please supply the pinout of the large video cable connector between the Atari laser printer and the Atari laser printer controller.

I have tried connecting the laser printer controller directly to a Canon Lbp-4 laser printer video port and it didn't work. Perhaps the pinout is different. The controller also doesn't power up when connected to the canon, where it normally does when connected to the inferior Atari laser printers...

Hmmmmm??? Well could it be a memory problem? Do you have the same
configuration (no of acc's, boot squence in auto folder, etc) in
the 16 color mode as the 256 color mode? Many times on my Hades
when I get an address or bus error, I have solved the problem by
just re-arranging my boot sequence. I do not know why it worked,
but it worked.

Hey Don,

I would just switch to Okami like I did. It works much better than
Newsie and does not crash at all. Look for an article I wrote
about it's setup at the MyAtari site, October issue.

Works just fine for me. I will have to get the newer version. The
only problem I am having is getting Porthos to properly make a CDK
copy of one of the pages of a file.

I used an identical setup when I tried in 16 and 256 color mode: I was
starting XaAES from my login console using -fvideo 26 for 16 colors and
-fvideo 27 for 256 colors. No changes in auto's and acc's.

I agree, that has been my point of view from the start.

Good points also.
It's not a whole lot different than UAE 'universal amiga emulator' and
I think some code parts were derived from that. There's no mistaking
that is an emulator, it's in the title.

> I don't like emulators. I see their value, but I don't regard them as an
> acceptable option for a primary-use OS. An OS is supposed to operate the
> hardware, directly.

They have there place. It seems to me most people just become so
convinced that another hardware based clone will never exist. So they
just keep loosening their definition of what an emulator and a clone
is. Perhaps it's money issues, lazyness not wanting to order
overseas, or just so they can rest easier at night. Needless to say
even if I was to use aranym, sell all my real hardware, I'd still
consider it an emulator in it's current form. I quite frankly don't
care who uses it, perhaps they do some good work with it, but just be
honest about what it really is.

> I don't really like the Intel peecee architecture. Part of the charm of

Yup.

> (which is NOT a Windows box. Never had Windows. Never will.)

That's exactly where I am too. I still see references to it else
where as 'machine' and the like. That's make believe land if you ask
me, but if it helps that person cope, oh well.

The Atari is a 19 pin controller. To use the LBP you simple plug into the Parallel port on the ST/TT. The Canon dosen't use the Atari controller at all.

Nice one, thanks for all that.
I'll try my Zip drive for now, see how I get on with that.
I don't think I'll ever really get upto 4 tracks of audio, nevermind
8, I'm primarily midi (though I realise I could record my midi tracks
into cubase for processing.)

Thanks again...

Rob

It can be downloaded OK now.

Maybe it should be mentioned that this game appears to be practically
limited to TTs and Falcons- and the (few?) Megas with graphic cards.
At the very beginning it requires a minimum screen resolution of 512x540
(or should it be 540x512?) and recommends 800x600.

Earlier versions have worked fine for me under Mint/NAES.
I have even helped out with a little bit of testing, Wolfgang
has been good at fixing problems and adding new features to
support the many versions of PDF.

It sounds like there may be a problem with this release but
I expect it will be fixed soon enough.

If you haven't yet tried Porthos I can recommend it.

Hello everyone,

I thought I'd try to get Linux up on my Falcon (again, actually... I succeeded about five years ago, but didn't do much with it).

Right now, the computer is trying to install the base system. It has been attempting this for several hours. Does anyone know how long this takes ... i.e., is the Falcon locked up or real slow? The floppy light keeps flashing, so I suspect the installer RAMdisk is still doing something.

I haven't been able to get the adapter working on the only TT I've
tested so far. After getting similar problems to you with the MAC
address as reported by STNGPORT.CPX, I decided to use the test
programs rather than implement STinG on my various systems.

I initially ran into problems with the test programs crashing. It
seemed to be caused by stack overflows, so I increased the default
stack size in the 3 relevant programs (ht1ene, ht2ene, ht4enec) from a
miserly 256 bytes to a hefty 1K (:-)).

After doing that, results so far (all running standard TOS):
1040ST Mega STe TT030
ht1ene get $ff get $1f get $1f
ht2ene OK OK Fails
ht4enec OK OK OK
STinG - - Fails

The timing issue that you point out could well explain why ht2ene
fails on the TT - I will change the delay & test - but the driver
itself contains code that should calibrate the count according to the
machine, so that doesn't seem to be the reason why the driver doesn't
run on the TT.

I'll investigate on my other systems & let you know ...

With ENEC3.STX set to run from TT RAM it almost works with STinG/Magic
here. I get the MAC address and packets are sent out but they seem to be
corrupted in some way...

>I'll investigate on my other systems & let you know ...

I do have some ST's and a MSTe that are compatible with this adaptor but
I would really like to use it on the TT.

First of all, it's a _very_ good idea to create a folder for each song you are working on, and make sure every file you create remains in the appropriate folder for each song. You'll be surprised how quickly you'll generate .AIF (and .WIF files; which are the graphical waveform files created by CAF for each .AIF file you create). If you are just recording into the root directory of a drive, it will very quickly become a mess of files!

As far as your warning that you couldn't record to that drive...

There's a weird little 'bug' in CAF (perhaps it was deliberate?) that can cause problems recording when you name the file. When you click record, if this is the first recording on this track, a dialog box will pop up asking you to choose a drive and a filename to record to.

When naming the file, make sure you don't use more than 7 characters (CAF will use the 8th character to automatically add a number for each successive take on that track), and more importantly, make sure you _also_ add the ".AIF" extension to each filename.

For example, let's say on your first recording you name the file "GUITAR.AIF". You record that take, but don't like it for some reason. If you are still on that track, and hit record again, CAF won't ask you for another filename; it will simply create "GUITAR1.AIF", and the next take would be "GUITAR2.AIF", etc.

The main thing though is to remember to include the ".AIF" when you name the file. If you don't, you'll get that popup warning about not being able to write to that drive. I don't know why, but that's just the way it works.

;-)

And by the way, send me an e-mail and I might be able to help you out
with regard to the "Audio" portion of the Cubase Manual.

I checked out that site a couple of months ago when my sister was thinking about a new computer to replace her HP. She told me about lindows.com.

If you get further into the site, I'm not sure you can say the machine was built specifically for Linux. I would guess the machines use standard off the shelf items. The majority of them use AMD's Duron and Athlon spu's. One has an Intel Celeron chip, and 3 have a chip identified as CIV(?). It might be CIS.

I think the real difference is the machines come from the manufacturer, Microtel, with Linux installed, no Micro$loth OS installed. The site also talks about Mandrake Linux, so my guess is you get a machine with standard off the shelf hardware with a windowing interface running some version of Mandrake Linux. (Sure is a world of different Linux versions out there isn't there!) These machines come with some type of software for making the change from Windows stuff to Lindows stuff easier for the user. Exactly what this does I don't know.

There is another company, ChoicePC, also offering Lindows machines.

The Microtel machines are definitely cheap. I wonder if you dare infer from the prices just how much money Microsoft gets for each copy of their OS that gets installed.

I think it would be fun to have one of these machines to play with, but even as cheap as they are, I don't have the free money to get one. (Too many debts for the amount I make. <G>)

Now, thinking somewhat outside the box, I wonder if ARAnyM would run on one of these. Any ARAnyM developers reading this thread that might be able to tell us?

Ken

What system do you have? The bootstrap TOS program ran well enough,
and I partitioned and set up the hard drive, but "Install the base
system" stops accessing the hard drive after about a minute (no
occasional HD light flashing), yet continues the install for ...
infinity?

I rebooted at midnight. When I left the house at 7:15 this morning,
it was still at it.

Hi,
I own the Dayna Pocket SCSILink and have been using it with the Anodyne
Software driver to transfer files from my PC to Falcon. The FTP server is on
the Atari, so I can use a gui client on the PC to do the file transfer.
I also own the ENEC from Lyndon, unfortunately I am not able to get that
working because I cannot find any suitable cards for it. The several NE2000
clones manage to report the NIC address but fails to response to any ping
from the PC.
In contrast to the Dayna SCSILink, I was able to ping and do file transfer
almost immediately after installing the driver and configuring the HDDriver
& STING.

If you can ping and do file transfer between your PC & Atari, then
everything should be OK on the network front.
Did you get the cab.ovl file? On my system I just install cab.ovl file and
cab was able to use the network.

Just a note to save people a lot of trouble: as Dan Ackerman noted, the Asante devices do not work. They are NOT valid SCSI devices, that is they don't follow the SCSI protocol (they don't follow the sequence of SCSI bus phases, they don't use 6/10/12-byte commands ...) . They just happen to live on the SCSI bus.

IF you had a SCSI bus analyzer, and IF you don't want to use (or coexist with) HDDRIVER, I think you could probably get them to work with a few hundred hours effort ...

> attached).

Yep, floppy is a problem with the software. Saw this & reported it to Roger (Anodyne). He said it is something to do with the falcon architecture of sharing floppy & SCSI IC chip. Since the software polls that SCSI bus, it kind of hogs it and so floppy will not work. He explained that limitation on his web page. I think it may be the same problem with DMA xfer (as experienced by me when using it with Magic).

Other than that, everything seems to be fine. My Falc now have ethernet access.

It's probably reminding ourselves that CAB (an OVL issue) seems to like to present the downloaded file for saving named as "dl.php", rename it appropriately with a zip extender and all is well.

Cheers

3267. using fonts in Papillon

Newsgroup: comp.sys.atari.st
Date: 2002-11-05 11:34:02 UTC
From: Martin Tarenskeen <nospam@zonnet.nl>
Message-ID: <Pine.MNT.4.31.0211051222120.44-100000@easymint>
Source record: 31224

I'm trying to use NVDI fonts in Papillon. It works, but I have to use fontsizes that are 4 times bigger than the ones I can use in other programs that can use the same fonts, to get a similar resulting size on paper. This means I can't use really big fonts in my Papillon pictures. If I use a 48 pt. fontsize, it still isn't very big on paper. When I use a 12 pt. fontsize in WordPlus5 or CAB for example, it gives the same result when I make a print on paper. (The numbers are just to give you an indication, and may be slightly different in reality).

My question: Is this normal ? Is there no way to use bigger fonts in Papillon ? Or should I finally get myself to learn how to use Calamus. (Calamus S came with my Falcon, but I never had the time to seriously try it)

Martin Tarenskeen

3268. Re: using fonts in Papillon

Source record: 31237

>Is this normal ?

I think I had the same.

>Is there no way to use bigger fonts in Papillon ?

Just enter somthing bigger. Next to the listbox where you are limited to 48
you can enter any number by keyboard. On my tests anything bigger as 1000
was reduced to 1000, but this is still ~21 times bigger then 48. And if that
ist still not enough, just use that size and blow it up later, as long as
you only enlarge it by a factor of 2 or 4 the quality should be good enough,
and since a 'A' with size 1000 is about 850 * 950 Pixels, that should be
anough for normal size printers.
I suppose that only works with vector fonts.

Try it with STinG 1.26 end of 2001. That doanï¿½s work.
STinG modules crash on MagiCMac. MagiCNet not tested.

You don't say which Atari you have. Almost all the "single box" Ataris, i.e.
ST, STFM, STE have the mice ports attached the keyboard purely by solder.
This tends to suffer from metal fatigue and after a while it cracks and you
loose contqact. This happens if you often swap mouse to joystick etc. Any
one who competant with a solder iron should be able to fix...

I've a CT2b and one of these EtherNEC kits...
Both of the STing drivers (enec.stx, enec3.stx) work in standard Falcon mode.
While neither of them work in Turbo Mode.

In the turbo mode...the mac address appears to be wrong, ping sends packets and the green light flickers on the NEC card, the swither's data light flicker, but ping reports 50 packets sent, none recieved. This is tested under CTb TOS (normal desktop) and with MagiC 5.01. Putting the driver in TT Ram doesn't help either...in fact...I recall some combination of TT ram flags on the enec3.stx not booting at all with NVDI.

I've still not gotten anything to happen in mintnet at all with this kit. I do believe because I'm just clueless about now to set it up. ifconfig and route, I've experimented with...but I must be missing something.

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware: AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video4.zip (156Kb).

There are some bugfixes for the three programs. AES and VDI test programs
can be run in whatever bpp (even monochrome), and whatever resolution.

Feedback still needed for these programs. Thanks.

I did setup MagicNet here on this TT just to check what would happen. The
results are similar to STinG. I manage to get the MAC address but nothing
more.

I have not tested this setup with my other pocket Ethernet adaptor yet so
I am not sure if I got MagicNet setup properly. It does seem to work,
though. I can Ping localhost and the local Ethernet port.

I also tried the other driver for MinTNet by Odd Skancke with MagicNet
but that one did not work at all during a quick test.

On my falc, this is what I get from the ENEC kit. I have tried 4 NE2000 compatible cards, most of the cards behave similar and none work with pinging to a external host (localhost works but that's just STING internally working).

> I have not tested this setup with my other pocket Ethernet adaptor yet so

With my Dayna SCSILINK pocket adapter, it's a different story. It worked right away, with the Anodyne drivers.

I guess that the SCSILINK is a industry class solution while the ENEC is a home-brewed solution, so the results may be expected :-). Anyway, it was worth a try for both and we need ppl like Roger, Lyndon & Thomas to help give ethernet support to the Atari.

Thank you. Now I found my real problem: I was using NDIALOG instead of WDIALOG. The NDIALOG fontselector doesn't offer the possibility to enter a fontsize manually by keyboard.

There are also still some other WDIALOG things that NDIALOG doesn't support, like the extended print dialog. NDIALOG could use an update. Is it still being developed ?

Hi,

I have a brand new box of 10x 2DD (double density) 720kb, 3.5 floppies for auction on ebay... these tend to work better in the Atari than HD 1.44meg disks ...

heres a link if you're interested..

http://cgi.ebay.com.au/ws/eBayISAPI.dll?ViewItem&item=2067010213&rd=1

Thanx!

... currently selling at AU$ 13.50, with three days to go. Strange,
since they are still being made, and quite a few office supply companies
mail order companies still sell them brand new. At least, they do in
Europe and the US -- I must admit that I don't know whether they do
Australia.

I recently bought a couple of packs, for EUR 2.90 per pack of 10, from
OfficeXL in Germany (www.officexl.de).

3286. Brand new DSDD disks for sale

Newsgroup: comp.sys.atari.st
Date: 2002-11-06 13:48:45 UTC
From: sonik@whsmithnet.co.uk
Message-ID: <3dc91dbd$1_2@news2.vip.uk.com>
Source record: 31245

Hi folks

It would seem that getting hold of new DD disks in the UK is harder than it seems.
I did a search on Yahoo! using just UK sites and came up with very little of use.
I did a more general search and the Aussies seem to have more than they know what
to do with so if you want to order from Oz, have a look at this:

http://www.downtown.com.au/cns1664.htm

A box of ten Imation disks is going for A$9.12 at the moment including tax although
it might be worthwhile orderin say five boxes at the same time to save on the cost
of postage from the antipodes. The Aussie dollar is roughly equal to 50 pence sterling.

Cheers
Al

Hello Carey,

That would be a nice thing to have, but I would just get one of those programs that would pop up and remind you to make a backup. I usually backup my system every 2-4 weeks and I always have two backups available. You never know when you will backup a faulty system. I have done that and I am sure others have also. If you want to backup to a CD, CDBackup by Anodyne is great. If you backup to floppies, then Diamond Back III is suficient.

You can check out some ftp sites and see if you can come up with something. I know I have seen Atari programs that can be set to activate in the future.

10-15 minutes sounds good for the program, but not for the base
system. On my Hades it took about 1-2 hours. I would like to give
Linux another try on my Hades, but ever since I upgraded my Hades
motherboard, Linux does not install properly.

1st of all have you cleaned the rollers? and 2nd have you made sure it's fully pluged in right? Check the pins in the plug, sometimes one or more of them get bent and you plug it in and the mouse doesn't work right.

Hi,

I had a CT2B (I have just received my CT60 ;-))
Timming are too shorts for the CT2B.
I have send some modifs to Lyndon/Redelberger during June.
I have just put the files at this adress:
http://perso.wanadoo.fr/didierm/files/enec_ct2.zip (400 KB)
EtherNEC works fine under Sting/MiNT.

Regards,

Didier.

At a recent computer rally "the computer junk shop" (0151 420 6671) was selling them for £2.5 per 100, packed as 10 boxes of 10, complete with labels. Might be worth giving them a ring to see where they are at next.

Richard,
Its been a long time but the following springs to mind ....

1) You just need to undo the screws in the "square" holes to get the case apart

2) The metal screen is a right bugger to get off.

3) Some keys (space bar and/or return) I think have only one rubber contact cup but have space for two. End result you think you have lost one....

4) You might one to use some epoxy to secure the socket. (but you might not as if you need to replace it its then harder)

5) When re-fitting be careful not to bend the LED (power? Floppy?) that stick up from the keyboard.

6) Buy an extension cable so it does not happen again.

7) Fir you are even slightly unsure, or not neat with a soldering Iron get some one else to do it.

Dave

Diamond back is good but ONLY when on use the commom 8+3 file system. It fails badly when one use VFAT.
AFAIK, under MiNT on can use cron to run an automatic backup.

There is also a German application called E-backup. This package contains ebatch.acc. With this acc one can run up to 16 program, for instance E-backup at a given time.
AFAIK, E-backup is a commercial program. A few years ago one could get a copy from AG-Computertechnik. If he still sells it I don't know. I'll see him saturday morning. If I don't forget it I'll ask him.
Anyway the program is all German.

Another solution is jobtimer.acc which comes with Kobold (fast-copy program). Jobtimer can execute Kobold jobs (for instance a backup job) at a given time.
Kobold is a commercial program distribute by ASH see:
<URL:http://www.application-systems.de/kobold/index.html>
Its all Geman but I believe an English version is available somewhere on the net. For more info see the homepage of DDP:
<URL:http://www.cix.co.uk/~derryck/index.htm>

Just took a long shot and tried your CT2B driver (ENEC2.STX) on my TT.
This was the worst one so far, did not even show up in teh STInG Port
Setup cpx :-)

Guess it doesn't like M68030...

3297. BBS program

Newsgroup: comp.sys.atari.st
Date: 2002-11-06 23:14:40 UTC
From: george@moulder77.freeserve.co.uk
Message-ID: <aqc7p0$ln8$1@news7.svr.pol.co.uk>
Source record: 31156

Your help is requested:-

I use an Atari fax program on two 4Mb ST machines without hard-drives for sending text between two telephone terminals, and wish to replace it by programs to send text-files instead.

The reason why this change is necessary is because of the increasing amount of fax corruption caused, I believe, by the new methods that telecommunication engineers are using to pass more and more information down each telephone circuit; and because of the lack of error-checking carried out by the fax-modems I use.

I have several good reasons for NOT using e-mails instead of faxes or file-transfer, so please don't suggest this.

Using the X-modem transfer protocol, I believe what is required could be acheived by a communications program AND a BBS program at each end. One end's BBS would be switched-on unattended and ready to receive for several hours each day, and the other end would need to be manned to UPLOAD a file to the remote BBS program using the communications program at its own end. It is not envisaged that down-loading will ever be required.

Could this be done more simply using the FTP protocol? If so, what programs would then be required at each end?

I have a suitable communications program but due to the extinction of BBS's I don't know of a simple BBS program that will fufill my needs, remembering that at each end of the system the programs must be contained on a 800k floppy-disk so that compact programs are essential. Has anyone personal experience of any particular basic BBS program, or can anyone suggest or even supply a PD one?

Assuming you have an internet connection, if not then there is alot more
setup to do.

I would look into something even easier, just run another terminal program
on the other end set to auto answer, auto download. Most terminal programs
have preset settings for these options and can be left unattended.

Not really. You just have to know where to look.

Imation still makes ds/dd disks. A little surfing on www.imation.com
(then linking to the UK site) revealed several mail order houses,
including Viking Direct, a British-American firm that I have often
ordered from (in America).

Try http://www.viking-direct.co.uk/shop/search/results.asp?DD%5FCAT=00&SearchType=2&DIV%5F
ID=11&CATG%5FID=1102&SEARCH%5FCNT=2&ANDOR=&WILDCARDS=%2A&STEMMING=%2A%2A&advancedqu=ds%2Fd
d&freetext=&pagecnt=&SID=LXD7N57MV36Q9PF05NPFP6LH0FB598AB
or search for "DS/DD" at www.viking-direct.co.uk . They are a bit
pricey (About 7 pounds the 10 pack), but they're available.

Diamond Back has additional problems. I used to use it to backup 30MB partitions to other 30MB partitions on removable media without trouble. However, when I bought CDISO (from Anodyne) I thought I could use Diamond Back to copy all the files on my little partitions to one big partition. It couldn't, and bombed the system.

I hate to say it, but Diamond Back (& Diamond Edge) are rather dangerous on partitions greater than some size, and I suspect it's 256 MB.

Actually, getting the install program started was under two minutes,
and I was provided with much scrolling text to read!

I let the base install run for 31 hours before I needed the computer
again. Believe it or not, I'm not sure I simply needed more time -- a
Mac iici user claimed a "nearly 24 hour" install time, and his system
is of similar power.

Does anyone have a good idea about how long it takes a stock Falcon to
unGZIP and unTAR 17 MB?

Hi Patrice,
Thought I'd run your test programs on my Falcon @ 32/50 mhz.
It would be nicer if a text file of the results is automatically saved.
However, there were no crashes and the low rez True color AES showed ok
but med and high rez @ 256 showed what seemed to be overlapping colors.
Is it only for the Milan?

Regards,
John G.

3305. [PROG] Need testers for video related programs (V5)

Newsgroup: comp.sys.atari.st
Date: 2002-11-07 15:52:40 UTC
From: Patrice Mandin <pmandin@caramail-NOSPAM.com>
Message-ID: <882eqa.9m6.ln@127.0.0.1>
Source record: 31165
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware: AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video5.zip (157Kb).

There are some bugfixes for the three programs. AES and VDI test programs
can be run in whatever bpp (even monochrome), and whatever resolution.
Output can now be redirected to a file (see doc in archive).

CentScreen (CT2) and Milan MVDI support are available in the XBIOS
program. Please test if you have them.

Feedback still needed for these programs. Thanks.

Sources available on my web site, in the cleancode-0.5.tar.gz archive.

No, these programs can be run on any machine. This is just a small bug in
the calculation of the 256 colours palette, not a problem.

I'm sending this message from my mac 9500MP which is running OSX 10.1.5 and
BeOS R5.03. You need a 3rd party installer from
http://eshop.macsales.com/OSXCenter/XPostFacto/
OSX does run on my machine as does MagiCMac for OSX. Unless you have a G3 or
G4 upgrade card OSX on a 603 or 604 PPC CPU is going to be slow. I have 208
Meg of RAM and a dual 180 604 PPC's though only 1 is being used under OSX at
the moment. Speed is OK to check OSX out but to be productive it just won't
cut it.
I can answer any questions you may have about installation and what not.
Just E-mail me as I don't check this group on a regular basis.

Hi Lonny,

Great! I wasn't aware that this could be done.

The programs I have are FZSTterm, Connect (demo), and Teddyterm, and all seem to my inexperienced eye to be highly complex, with a multitude of variables very difficult to interpret how to give auto answer, auto download.

Are you familiar with any of these programs and which program would you consider is the simplest for me to use, or would you suggest another one?

Specific instruction on what variable to select would be ideal.

Thanks for your help!

The commercial communications terminal program STalker is also a
possibility. It has a sort of mini BBS mode that can do what you ask for.
There is also a rather complete programming language built in that can
automate lots of things. There are lots of different settings inside the
program to master but the manual is very good and the "mini BBS" mode is
fully described. I have not tried this function myself, though.

STalker runs both as an ACC and PRG file and will fit without problems on
a non harddisk system.

I suppose you still can get it from Gribnif Software. Should be easy to
locate via http://goggle.com/

> > EtherNEC works fine under Sting/MiNT.

I did try these drivers in CTurbo mode and they work wonderfully!
Just some things I noticed...
On my system...in tests so far with MagiC 6.01, HDDriver 7.93, and STing...
In true Falcon mode (TOS 4.x, no cpu or bus upclocking, no TT RAM)...the
EtherNEC seems to be about the same speed as the Dynalink. In CTurbo mode...the
EtherNEC, at least on my system, is MUCH faster than the Dynalink solution (SCSI
timing remains consistant, therefore the dynalink gives the same transfer rates
[which aren't half bad] wether Falcon is upclocked or not).

Later, I'll post some of the numbers my Falcon reports after some more tests.
This might help Falcon owners in search of an ethernet solution select the
better kit for his needs. Personally, I'm very glad to have both...they can
both be installed on the same machine and work quite happily side by side,
different situations often make one or the other more convienent, and I also
have other TOS machines to gradually add to the LAN.

And yay!!! I also managed to get the mintnet driver from this kit working as
well. I'm still a bit stumped how the route and ifconfig all ties together in
conjunction with my LAN swither/adsl modem...but things look very good so far.

Brian

Well, as Kenneth suggested I to recommend STalker if you wish to
have alot of control. I'm afraid I never used the ones you mentioned,
I purchased STalker quite sometime ago. I even highly modified
the included BBS script into a full featured BBS with message bases and
all. However, have not used it since I discovered the internet. ;-)

If you cannot find auto answer, try entering ATS0=1 [press return],
that sets the modem to auto answer, and the "1" is the number of rings
to pick up on.
Find the default download path and set that.
And perhaps set the default download protocol to zmodem, since zmodem
allows batch downloads.
I would think those prg's you mentioned could do this.
Especially Connect, I read may times it is quite good.

Lonny Pursell http://www.q1.net/~atari/html/for_sale.htm

I was forced to use google groups whilst my cable modem was down.
Needless to say I actually saw this post.
You would not know a fact if it hit you square between the eyes.
The only fact that remains is you have no life.
If you are so full of facts then why would I filter you out?
Ponder that.
Also, you tend to read EVERY post here, so the mere mention of your
name generates yet another mindless reply.
Hense, I predict you will reply even knowing I'll never see it.
Am I right? Is the temptation that great?
Wait don't answer that I'll miss the reply.
What to do? ;-)

Anyway this is my last read from google, you are filtered out in my
daily reader.

Hi

It would be :) but i need the vga version and that hasnt been free to
download.

Some nice person sent me the files from the USA, but they dont seem to
work on a UK (pal) machine, the display was unusable.

My thanks to Kenneth Medin and Lonny Purcell for answering!

Gentlemen,

I see that you both recommend Stalker, but for the moment I have decided to
begin work with the advice that you have given me, and the programs that I
already have!

Inspecting these more closely, Teddyterm looks the least frightening, and
it has a box specifically to select auto-receive.
Then, as Lonny says, the modem itself can be set to auto-answer, and
hey-presto, I should be in business!

There is one other question before I disappear and do some experimenting:-

The difficulty in testing any set-up like this is that it can't be done at
one location unless one has TWO telephone lines.

Do either of you know of an easy way around this problem?

Thanks again for your help and encouragement,

George Moulder

>
>Do either of you know of an easy way around this problem?

To test if it works you really need two telefone lines as the
recieving modem will respond to the incoming call by raising power to
special lines in the modem cable. Maybe it's possible to simulate this
with another computer? Atari or pc? I don't know if such applications
exist...

The communication part after the initial modem handshaking can be tested
by using a nullmodem cable and two computers.

Also note that TOS is rather buggy regarding serial connections.
You should have hsmodem7 in the AUTO folder to correct this. Easy to
find be searching for hsmodem + Atari.

Null modem cable as Kenneth suggested is the only way I know to
do testing, but then that requires to machines close enough to
each other to hook up the null cable. Run the terminals on both,
set all the options on both, then start sending files.
I've also done this sort of testing. It's a snap really.
Good luck. Glad to help.

3325. Nostalgia on nostalgia: PDP-11 emulated on Atari?

Newsgroup: comp.sys.atari.st
Date: 2002-11-09 10:42:05 UTC
From: vdjole@EUnet.yu
Message-ID: <aqiopr$h75$1@news.eunet.yu>
Source record: 31185

Hi;

Maybe some older :) readers who remembers the days of PDP-11 computers might find it interesting that there is a free-source (C++) SIMH emulator of PDP-11 at http://simh.trailing-edge.com which is designed to be compiled on a variety of host machines/OS. Atari/TOS is not among them, but it looks as if with just a little tweaking it could be convinced to run on Atari computers. Gnu C/C++ should be the preferred compiler; I don't have it installed but even with Pure-C SIMH almost compiles- a lot of warnings is generated and few occasional errors. Build is not complicated, just about 20 files to be compiled and linked together.

Judging from comparison with similar emulators running on PCs, on faster Atari machines SIMH, if successfully built, should run at slightly higher speed than "real" PDP-11s, and even on a ST-series machine the speed should be satisfactory.

A number of disk-image files for system disks with various operating systems like RT-11, early Unix (Unix was created on a PDP, AFAIK), and RSX-11M (harder to find) is available on the Net, or one can create disk images from a live PDP if one is still available somewhere. At those times disks had small capacities, 5MB or so...

In fact, SIMH is notjust a PDP-11 emulator, but also includes emulators of Altair, Nova, VAX and some other computers of historical interest.

Not of any practical use for most people, but might be fun...

Hi folks

Situation: I have downloaded some WAV sound files from across the net and decided to import them into my Akai sampler. I started using a small freeware program called WaveDump (from the superb and much-missed Electronic Cow people) to transfer them. Most of the WAVs transferred well but some refused to be loaded for some reason.

I then decided to try Zero X, a bigger and more comprehensive program. I had two demo versions which were both demos and had sample transfer disabled.

Request: can anyone tell me where I can get Zero X (full version) or does anyone here have it? Alternatively, can anyone suggest a program that does transfer WAVs to Akai samplers? I know of one called Akai Sample Exchange but the link to that are dead.

Cheers

I would never use Diamond Back on big partitions anyway. The
amount of floppies would be very high and I did not like using the
Tape backup. It is good for backing up some partitions or certain
files on partition. For anybody with a regular ST/STe, this
program will be fine. It needs an upgrade and hopefully will get
one by the guy who bought the rights to it.

Message-ID: <3dccb95a108d278@attbi.com>
Source record: 31188

Hello,

Every year about this time, I print out my Christmas address labels. I just recieved Calamus SL 2002 and used it to formulate my labels. Everything worked out fine except when I went to print them. The labels printed fine, but on the sheet I also got 7 nasty red lines. I am using the VDIprint driver that allows me to use any printer that NVDIis compatible with. This all worked fine last year. About the only things I have added are the newer Calamus and MagicNet.

I tried to print the labels under plain TOS and Geneva. Those times the labels came out fine, so I just printed them out under Geneva.

Anyone have an idea as to what the problem is? Or is it just a bug with Magic that has to be solved? I did use one of the other printer drivers that came with Calamus. The labels printed (did not look too good) and I got no red lines. I guess maybe that VDIprint needs an upgrade. I did post this on the Calamus forum, so maybe they have some ideas...

Cheers....

Edward and Martin,
I am trying to backup ALL partitions on my 40 GB IDE
drive to another Hard Drive!! Not Floppy backups or
CD's, lord knows I have quite a few CD backups, been
doing that once a month for the last year or so at
least. I found a program that has TIME STARTER option
in it. It does not look very complicated and has MANY
other features beside the Time starting option.

Thanks,
Carey Christenson

I am not sure about this, but I -think- that somewhere on the 'net I saw
that a telephone line can be simulated with a suitable power source,
some resistors and possibly diodes. Carrier-detect should be disabled
on both modems in this configuration. I do not know anything more, e.g.
how is the ringing simulated, if it need be simulated at all?

Note that LFNs are only catered for with Kobold 3.5. To date, no
English version has been published, since there has been no
interest from the ASH UK distributors - possibly because they
believed that V4 was due to come out soon, though AFAIK this never
appeared. I translated 3.5 for my own purposes with Harlekin's
Monitor (HEX editor), but since it is commercial I can't pass it on.

If you get hold of a German copy, I could mail you the English
strings that you can put in yourself (there are quite a few :-(
but it should be manageable).

3338. Atari 130XE, would like to recover whatever I can from my old floppies

Newsgroup: comp.sys.atari.st
Date: 2002-11-10 02:30:18 UTC
From: piclistguy@yahoo.com
Message-ID: <97d41df6.0211091830.33f90fa4@posting.google.com>
Source record: 31098
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy

I received an Atari 130XE as a gift in 1986. It was my first computer.
It has a nostalgic value to me. I miss all of those games on my
collection of floppy disks. I would like to see again some of the many
programs I created in basic. However, it is now 2002 and I haven't
touched the 130XE in over 10 years and its at my parents home
thousands of miles away. At this point, all I can hope for is to
salvage some of the data on my floppies. I don't worry at all about
the hardware, since if my 130XE doesnt work anymore, I could try to
have it repaired or buy an old one from ebay.
But my data is something that can't be replaced.
Is their any way I can recover the data on my old floppies?
I don't want to setup my old computer to salvage the data. I am
concerned that the 130XE disk drive could potentially damage the
disks, since the drive itself is quite old. Ideally I would like to
find a way to use a PC with a 5-1/4" disk drive that can read an atari
diskette and write the exact bit pattern to a brand new 5-1/4" disk.
Even better if there is some utility that can perform some type of
error correction on corrupt sectors. Or perhaps there is some service
center that specialized in what I need done.
Please explain what I options I have to recover my old data.
Thanks

If you want, I have a decent drive setup which is attached to my PC via an SIO2PC cable. I can copy your disks into ATR files for use in an emulator, or just dump them to TXT files for you to look at on your PC. All I'd charge is the actual disk media itself to recycle for my own use. The drive I use has very little millage on it so I don't think there would be any problems there, although your disks are 10+ years old and may or may not be readable (I'm sure they are though). Let me know,
Mo

Hi Martin,

>AFAIK, E-backup is a commercial program. A few years ago one could get a
>copy from AG-Computertechnik. If he still sells it I don't know. I'll
>see him saturday morning. If I don't forget it I'll ask him.
>Anyway the program is all German.

Back in 1996 I translated the program, from version 2.05 onwards it was sold
with the German & English versions on the installation disk, and the English
manual was available on demand.
AFAIK, the development of E-Backup stopped in 1998 and afters selling it at
discount prices at several German Atari computer shows the remaining stock
was sold to Peter Denk Computers.

>Kobold is a commercial program distribute by ASH see:
><URL:http://www.application-systems.de/kobold/index.html>
>Its all Geman but I believe an English version is available somewhere on
>the net. For more info see the homepage of DDP:
><URL:http://www.cix.co.uk/~derryck/index.htm>

Although Peter West translated it, the English distributor has never released
it. But there's a patch floating around for version 3.50 that will translate
more or less 80% of the program. That patch however is not supported by DDP.

Cheers from Belgium
Dennis

Hi,

I have an ATARI import from the states for sale. Following hardware:

ATARI 520ST
ATARI colour monitor
ATARI Sf354 external disk
ATARI printer
power transformer (will work in UK)

The beastie needs to be picked up from East Sussex. Please let me
know if anyone is interested. Thanks,

Robert Corrie

3346. DSDD vs DSHD floppies

Newsgroup: comp.sys.atari.st
Date: 2002-11-10 14:29:11 UTC
From: Michael Livsey <nina.michaelNOSPAM@btinternet.com>
Message-ID: <aqlqfm$ns7$1@helle.btinternet.com>
Source record: 31102

I've been experiencing a few problems with data on my Atari 1040 recently, and it's been pointed out to me that the high density discs can cause problems - I've been using a few alongside the double density discs, and in my naivity I thought they were OK - at least they seemed to work. Would simply taping up that other hole and carrying on with them be more reliable, or should I tape the hole up and re-format first, or chuck them away altogether? Any ideas? To be honest I don't understand the difference.

I believe that the magnetic flux on the HD is lower than DD's... you can use HD's but eventually you will lose data.... maybe not straight away, but you will lose it at some point.

I believe Nick is right. And I remember either hearing or reading the magnetic coating on the disks themselves was also different. I had no problems with the HD disks when they first came out, but eventually (basically) none of them would work for me.

Why would anyone need that outdated disc?

Better replace it with a newer kernel (FreeMiNT 1.15.12), a much better AES (XaAES 0.960 or newer), and a better desktop (THiNG 1.27).

You could also take a look at the EasyMiNT installation, if your Atari is powerfull enough. (030 or better, enough memory)

http://www.freemint.de is a good place to start.

You are aware that ne2kenec (my driver) uses interface 'ne0' and not
'en0'? In anycase, I would be interested in hearing from you if you can't
make it work.

LS

There is a new version available on my homepage (in sig)

1
Various fixes causing more robust behaviour of modal dialogues.
Some programs (ScanxPro) lock only the mouse when displaying a modal dialogue.
This is now recognized.

2
evnt_multi: if parameter 'clicks' is zero, treat it as 1 where applicable.
This fixes another problem in ScanxPro.

3
Fixed the bug resulting in unwanted and irritating flimmering of the menus.

4
Increased intuitivity of debugging.
Changed syntax of 'debug all' and 'except'
'except follows 'all' on the same line.

A 'typical' debug setting could look like this:

```
options testprg
{
debugpoint all except kern,a,i,k,o,r,s,v,x
}
```

'but' can be used as a synomym of 'except'

The example reduces the output for testprg a little bit.
At the same time the debugging system provides a little bit more info
from the environment. This increases the chances of getting the info I need.

Only a really old PC with archaic disk controller would be able to read the single density FM coded Atari 5.25 floppies. Even the 1050 non-standard MFM enhanced density does not seem compatible with PC floppy controllers.

Building an SIO2PC cable involves using your XE and drive for the transfers as does use of a null modem cable. BTW the A8 drives use a crc type checksum when reading the sectors.

When you remove your hardware from the picture, you only leave 3rd party hardware. I am unaware of any commercial providers of transfer service; just a few afficionados like Mo and myself who have done it for other former Atarians.

Hi Sanjay,

If you do pick up a used 130XE and drive, you could probably test it out one some blanks or duplicates of stuff. Or you could also pick up a drive from one of the remaining mail order dealers, theres a few around. That way you could get yourself a drive that works reliably to recover your old stuff. Believe it or not I got a couple well used 1050's and 810's that I've managed to kept in good order. Wasnt too hard either.

I can see what you mean bout not bothering with the one you left in your parents house. If its in another country the shipping would be expensive and it would probably be a different video standard and perhaps require different power supplies as well.

Hi Nina

I think there is a fundamental difference between single sided, double sided and high density floppies. I'm not big into the actual technology of them but the tracks on a HD are closer together than a DD and the drives on STs are not designed to use them as they experience problems both reading from the format and writing to it. You can buy a HD drive for your ST (anyone know where? My local place is Analogic in Surrey and I think they do them). I would suggest not using HD disks with your ST and buying some new DDs instead as they are much friendlier to our ageing machines!

Cheers
Al

Greetings,

I am the former owner of Oregon Research and author of Diamond Back 3, Diamond Edge 2, etc.. I have some interest in porting my former commercial Amiga Internet programs to my original platform of choice: the Atari. I am looking for a TT030 with TOS 3.06 and 1.44mb floppy, 16 mb TT ram preferred. I am also looking for a Falcon with internal HD and 16 MB.

I am also looking for some original Atari programming documentation, including the original Atari Developers Kit, Falcon addendum, and Lattice C 5.60 documentation.

Thanks you very much,

Bob Luneski
res0eyeq@verizon.net

Hello

Diamond Edge is a great program, sadly it has some bugs and is incompatibile
with modern enchacements (long filenames). would it be possible for you to
release them for free, or even release sourcecodes?

You can start here, Atari Compendium online, which is more or
less the Atari devkit rearranged into a book.
http://www.fortunecity.com/skyscraper/apple/308/

Porting some useful programs is very cool idea.
please don't port another tcp/ip stack though, we got too many as it is.

Message-ID: <u421tucne65unvi467g6udf9067ugocdi0@4ax.com>
Source record: 31124

A further update on my TT testing. Although the Thomas test programs & driver totally failed to obtain the MAC address from the card, Odd Skancke's driver (run under MagicNet) succeeded. Unfortunately when I then activated Magicnet, the system crashed badly after about two seconds, so more debugging is necessary :-(.

I think it would be useful to collect some info from anyone with a TT and the EtherNEC interface so that we can try to determine exactly wher the problem is. Please email me with the following info & I will summarise for the net:
. does your setup work?
. what is your TT config (ST / TT RAM) & motherboard rev (if known)?
. what operating system / version are you using?
. what network software / version are you using?
. which drivers are you using?
. when the network card is plugged in but the network is idle, what LEDs are lit on the card?

Roger

There was an '030 version of MultiTOS? I don't recall there ever being one available for sale

I purchased MultiTOS from Hisoft in mid 1994 when I finished upgrading my TT development software [Lattice C 5.60, Devpac 3.10] and purchased system software [SpeedoGDOS 4.10, MultiTOS]

I only ever knew of one commercial version of MultiTOS : it contained MINT 1.04 and AES 4.0 - neither of which were '030 optimised

At present, I am still using Lattice C v5.60 to do most of my application development, and Devpac v3.10 for some system software (primarily my DLL manager which is partway through a 10th anniversary tidy-up)

I also use MiNT 1.15.9 and AES 4.10 (from the net), and still use Speedo 4.1 (is it worth upgrading Speedo to 5.7? and if so, where? how much?)

--

Download the latest DLL manager for the Atari ST. Visit http://www.atari.net.nz/gem/software/tlbx.html and download the Toolbox today!

Hello everybody,

I am still working on my test programs for Atari systems.
The latest archive is there (88 Kb, only sources, no binary):
http://membres.lycos.fr/pmandin/download/src/cleancode-0.6.tar.gz

It contains:
- Bugfixes
- Video: Added cookie detection for Overscan hardware.
- CD-ROM: Preliminary test program for Metados.

I need the Metados developper disk from Atari, so if anybody can send it
to me, I will be grateful. I don't need the bindings for Metados
functions, I have them.

Thanks.

Hi folks

Firstly, a big thank you to everyone who posted info or sent me links etc for various sample processing progs, including the full version of Zero-X which doesn't run on my STE but I've been told is fine on a Falcon.

Cheers to Jos in Holland for sending me Avalon which is a real pain in the arse! This program boots only in hi res and manages to disable my mouse in the process which is a pain. It is an interesting program but I'm slightly wary of its ability to handle WAV files...it doesn't seem to like them.

By the way, does anyone know of a program called Midian which does much the same as the above? That sends SND files over MIDI but not WAVs! It would be nice to have a program that does both!

Cheers
Al

Correct, I am not at liberty to release the code. I sold the original code to DB2 and DE2 when I exited
the Atari market in 1997. I believe the Rodger Burrows of Anodyne Software currently has the rights to the
original code.

What advantages are there to those versions?

I'd love a Lattice C friendly debugger - that works with memory protection turned ON. (Hisofts MON works OK, but hangs the system when invoked within Multitos. I have to boot to singletasking TOS and debug within that - which isn't so good)

--

Download the latest DLL manager for the Atari ST. Visit http://www.atari.net.nz/gem/software/tlbx.html and download the Toolbox today!

You should read changelog, but the most important things are bugfixes.

Aditionally 1.16a offers some more funcionality, but most of it is invisible
to the end-user (more for programmers).

Ten years experience with customers says stay away from HD floppies. 90% of
failed discs are HD.

Before fitting an HD floppy remember that if your ST fails you will not be
able to access your data until you have it fixed unless you have another
compatible machine.

Hi,

is there anybody who owns a Steinberg DMA-to-SCSI interface ? I am looking
for the drivers!!!
I don't know their names, so this seems to be the only way of asking.

As far as I know, there exists an interface called LACOM with compatible
drives.

Any help is very welcome!

Thanks, Mike

[replace "-at-" with adequate char and last dash is a dot]
Hello,

I have just found out Pacifist and begun to look for some old games
ovre the internet.

The problem I couldn't solve throught the FAQs I found is:

some archives contain ST files in IBM-PC Dos format, so how can I
"copy" these files into an ST disk image?

Thank you

Frank

No Avalon only reads SMP (native format) and SD1 files. Version 2.1 can read
AIF.
Use 525 sample converter to convert your waves in SD1.

Again, Avalon only disables my serial mouse with genmouse drivers when I'm
in the editor, normal Atari mouseport shouldn't be a problem.

Cheers,

Jos

Hi all,

This is quick post asking for your help. I will shortly be launching a new site called ATARItoday. It is a portal site for Atari users that features all the latest headlines (from Atari.Org, AtariAge, Atari Users Network, Atari-Source, ST-Computer and Polish Atari News Page) as well as links and reviews of Atari web sites.

I need your help to beta test the site at www.ataritoday.com and to suggest links to include in the web directory. Please send any suggestions and comments to me ASAP so I can fine tune the site before officially launching it.

Many thanks,

Matt Bacon, ATARItoday

Hi,

Everywhere I come people are happy to see if someone still supports 8-bit by selling software/hardware or even repair.

There aren't that many active people anymore where you can get replacements or even new hardware for the 8-bit.

When you don't want to read the news don't, but give Ben a break here. He is just one of those people that's still around in the Atari scene where so many already left....

3396. Cable modem/DHCP

Newsgroup: comp.sys.atari.st
Date: 2002-11-14 12:14:44 UTC
From: "Derryck Croker"
Message-ID: <1037272552-045871AEicMi@ntlworld.com>
Source record: 31056

Hi all,

I'm on the verge of going broadband :-)

The connection will be Ethernet (from an ntl: set-top cable box), and I'd obviously like to use it with my Falcon.

The Falcon is already part of an Ethernet network with my Mac clone and a laptop computer using MagxNet and the ROM port/Genius parallel port Ethernet adaptor.

I think that the problem will be that the ISP uses DHCP to assign your IP address, and if I'm not mistaken, there are no suitable drivers (STinG or MagxNet) for this protocol?

Any experience with this setup out there please?

Cheers

Derryck

The best solution is to get a router that has DHCP support built in
and plop it between your falcon and the modem? The Falcon can then
avoid having DHCP software on it's end. There was a package for Mint
last I heard, but it was not tested as far as I know. If that would work
under magxnet is yet another issue in itself.
I have router wedged into my setup. Perhaps someone else can add to this
as I am not an expert. ;-)

In this situation, you'll almost certainly want, and possibly need,
some sort of NAT router. Most cable modem providers deliver just one IP
address unless you shell out more money for additional addresses. Thus,
broadband cable routers from NetGear, Linksys, and others are popular.
These devices connect to the cable modem and obtain the external IP
address. They then use a built-in or external hub or switch to connect
to all of the computers on your LAN. These computers use the Internet
connection via Network Address Translation (NAT), which means they're
assigned IP addresses in a private address range, and the broadband
router modifies their outgoing packets so that they appear to come from
the router itself. Return packets are also modified so that they reach
the destination. The end result is that you can run several computers
on a single external IP address. There are also software packages for
"regular" computers that will let them perform this function, but it's
usually easier to set up a broadband router.

On the local network, you can continue using static IP addresses if you
like. Alternatively, most broadband routers provide simple DHCP servers.
You could use DHCP for computers that support it, and ignore it for
those that don't -- just be sure to assign static addresses outside of
the range that the DHCP server will be providing!

3400. Teradesk goes GPL

Newsgroup: comp.sys.atari.st
Date: 2002-11-14 18:13:37 UTC
From: gokmase@bigfoot.com
Message-ID: <366c6d2a.0211141013.21dea66c@posting.google.com>
Source record: 31060

The wellknown desktop replacement from dutch coder Wout Klaren has
been released as GPL. Many will recall this application as efficient
in terms of speed and memory useage, and now it also seems to become
the first open source desktop for the Atari! Amazingly it also seems
like Teradesk has found a new maintainer in Henk Robbers
(XaAES, TT-digger, AHCX, etc) who intends to
maintain future versions of Teradesk.

Hi all,

I recently put a little work into PopGEM (the POP-inbox tool by
Kellis) and fixed some things in it. Most noticeably:

1) The shareware limitations are removed
2) The bug (in version on TOPP) causing probs to download emails, is
fixed
3) Problems with building incoming mail as HTML has been fixed
4) Cleaned up and restructured some parts of the code

You will find sources and binaries on The Orphaned Projects Page.

http://topp.atari-users.net

Regards,

Joakim

Derryck,

This would be probably more challenging to do under STiK/STiNG but under MiNT, although while there is no dhcpcd package compiled I'm sure I could get it running. Once it runs under MiNT with MiNTnet, it should work pretty well under Magx with Magxnet. This is all in theory though. In practice it may be better to get one of those linksys cable/dsl routers that handle the dhcp of the public ip and give you an internal network of 192.168.1.0-255 so you can hook up other computers if you feel like it. The same can easily be accomplished with a linux box with ethernet of any sort and probably some day an atari with mint. (if not already). You could also go for a less consumerish, more expensive cable/dsl that will give you a static ip (or 6) like I have ;-)

Our solution was $5 Sparcstation IPX, install linux, sit it in the corner and make it the slave of everything, email, web, ftp, ip nat, firewall, etc.

Why would this be so hard for STiK/STiNG? A DHCP client for either would
not be that hard, it's a fairly simple prospect. Not really much more
complex than having a program to automatically check you popmail account
after some period of time.

There is/was a DHCP server for MiNT Net announced a couple of years ago. I
have no knowledge

of is operation or location. You should be able to find it with a bit of searching.

If your ISP use a simple "modem" where your PC needs to run PPPoE or
something similar, you can set up your PC (or Mac) as your local network's
gateway using NAT. Or if your ISP use a modem/router with built-in NAT and
DHCP (like mine), you can just ignore DHCP and just assign each computer
static adresses. In either case you don't need to bother with DHCP on your
Atari.

3406. PageStream and Postscript

Newsgroup: comp.sys.atari.st
Date: 2002-11-15 03:41:46 UTC
From: "Thomas J. Andrews" <tjatari@dreamscape.com>
Message-ID: <ut8rcf2u0ace04@corp.supernews.com>
Source record: 31066

I have several PageStream 2.2b documents I'd like to try to print with my Linux PC and Epson inkjet printer. I tried outputting to a Postscript file, but when I load into a Linux viewer/printer the paper orientation comes out mismatched to the layout. For example, a portrait layout looks ok, but the paper is displayed as landscape. If I print it, the printer prints in landscape, but the printed material is laid cross-wise on the paper, portrait-style. It's difficult to describe. I hope you get the idea.

I believe the problem is in PageStream's Postscript driver, and that it's putting out the wrong code for paper orientation. Does anybody know if there's a Postscript driver for PageStream 2.2b that corrects the problem? Or, failing that, does anybody know where I could find information on how to edit the paper orientation code by hand?

TJ

TJ,

I printed this article out from knode in landscape mode and portrait mode
and then I ran diff on the postscript files and got this: I imagine this
could help you hunt down what is wrong with the page dimensions or
orientations in your own postscript files.

```
sh-2.05b$ diff print.ps printland.ps

>Any experience with this setup out there please?

I'm commenting to my own message because of the number of replies, thank you every one who's responded :-)

I've come to the conclusion that a hardware router is the best solution for me, and at about 60UKP isn't too expensive as it can be hidden as an early Xmas present ;-)

I'd still like to hear of a solution to the business of using a Mac's Ethernet port under MagiCMac, I'm surprised that this apparently hadn't been addressed a long time ago. I'd like to continue to use some Atari Internet clients under MagiCMac, Emailer is still the easiest and neatest mail and usenet client IMHO, although I'd be happy to use Okami.

Of course there's not really any competition to using the usual browsers under the native OS for web browsing :-(

Cheers

Derryck

If you would be interested in joining in a small GEM programming competition this holiday season, send me an email at my netset account. If there is enough interest I'll finalize everything up next week via email.

Entries would be a small GEM Toy or Game with a seasonal theme.

No cash or Prizes, just programming for the glory and fun.

Please drop by http://gemcandy.atari-users.net and vote in the poll as well ;)

>on a single external IP address.

Note that, AFAIK, the NAT router has to have a sort of extended capability
in order for the FTP to work. I think that most, but not all NAT
implementations have this feature (this has something to do with the
network address being contained in the packets themselves when FTPing,
contrary to other TCP/IP traffic- or something like that).

>There are also software packages for
>"regular" computers that will let them perform this function, but it's
>usually easier to set up a broadband router.

It may be of interest that there seems to be some old and fairly simple but
probably sufficiently good routing/gateway stuff for the PCs, running in
plain DOS (don't know if it handles NAT). According to the docs, even an old
PC AT at 10 or 16 MHz, equipped with two network cards and running DOS
has sufficient capability to handle 10Mbit/s Ethernet routing without
bottlenecks. In this way one could provide himself with a router at no
cost at all.

I am very glad to see this! I have always regarded Teradesk as the only practical solution for a desktop in a multitasking environment on small machines (the ST/MegaST range) and I have very few complaints regarding its functionality, i.e. only: the absence of "Search" , "Format", "Delete" and "Shutdown" menu items, the inability to set program running mode (single, parallel, limited memory...) in a multitasking environment and the inability to reconfigure keyboard shortcuts (it seems that only TOS desktop of them all can do that?). Otherwise it is just great and works nicely with Geneva, Magic, Mint...

Hopely, with any new versions it will remain a small and efficient program, as opposed to nice but very demanding Thing and Jinnee.

> Amazingly it also seems like Teradesk has found a new maintainer in
>Henk Robbers (XaAES, TT-digger, AHCX, etc) who intends to
>maintain future versions of Teradesk.

Funny... liking that desktop, I have meant several times to ask Henk if he, by any chance, knew anything more about the fate of Teradesk, being from the same country as the author of that program :)

best regards;

True. FTP isn't unique in this respect, either. Some NAT routers fail
with specific protocols. Most NAT implementations work fine with all
the common protocols, though, including FTP. Some gaming, multimedia,
and VPN protocols don't work well with many NAT implementations.

That last remark would have made perfect sense if every country had no more
than 150 inhabitants.

Acording to anthropologists 150 is the largest group in which every member is able
to know everybody else.

;-)

But you are right, I wanted to see teradesk for a long time.
It was only recently that I got time for it and did a google search for Wout Klaren.
Luckily Wout's email address was still valid after so many years.

A email of mine to Wout coincided with the contacts between
Wout and Joakim (TOPP)

Correct. Some protocols (FTP, IRC DCC, H.323, IpSec come to mind) require
special support from the NAT device.

>It may be of interest that there seems to be some old and fairly simple but
>probably sufficiently good routing/gateway stuff for the PCs, running in

3430. Re: PageStream and Postscript

Newsgroup: comp.sys.atari.st
Date: 2002-11-16 17:52:59 UTC
From: atoz <atoz@home.net>
Message-ID: <%BvB9.4248$aB1.77@nwrddc02.gnilink.net>
Source record: 31090

Thomas,

Some time ago I had to convert a bunch of Pagestream documents
from the ST onto my PC. I managed to convert them into Adobe
Acrobat. It was a tedious process, but here is the basics of it. I
did all this on my PC running TOSBOX emulator.

1. Use the IFFILBM.PRT driver with density set to 7. Print each
page into a seperate .IFF image file. Unfortunately I couldn't find
a way to get Pagestream to print each page to a seperate file.

2. Use a graphic editor (i.e. Photoshop) and convert the files from
.IFF to Postscript (.EPS). I created an automatic script in Photoshop so
that all I needed to do on each picture was do a CTRL-F2 to perform
the conversion. I still had to open the files, but Photoshop allows
multiple file opens at one time.

3. Then used the feature in Acrobat 5.0 where I copied the postscript
images (.EPS) into a directory and Acrobat converted each .EPS file
to a .PDF file. Then I just used Acrobat to place all the pages in the
right
order into a single .PDF file.

Like I said, it was a lengthy process. But it was the only method I could
do to get the documents converted.

For your job, you could just do step 1 and then use a program on your PC
to print the .IFF (or convert it to another format then print).

Good luck.

3431. Milan SCSI problems

Newsgroup: comp.sys.atari.st
Date: 2002-11-16 18:43:49 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3dd691e5.0@entanet>
Source record: 31094

Can anyone help, I am having serious problems with my Milan SCSI devices.

At boot-up the SCSI driver detects the attached device (Scanner or Syquest) and HD-Drivers config utility can detect and identify them but any attempt to access the device causes the Milan to lock-up and the LED on the SCSI card stays lit.

The problem seems to have started when I removed my PCI and ISA cards while trying to get my 68060 upgrade working. I know the 68060 isn't the cause because it happened with the 68040.

Scan-X Pro doesn't report any error as the Milan just crashes and I have to press Reset. I have tried my Syquest and an internal SCSI drive on the PCI cards internal connector and they all have the same problem.

I am beginning to think I may have damaged the SCSI PCI card. Is there any way to test for this ?

The card I have is a Topsys CI-2520/60 Rev C Ultra SCSI

I will welcome any suggestions. I think I may have to get another SCSI card just to make sure it isn't that. What type of card should I get ?

Regards,

Peter

Does this mean there is a chance to have a new, up-to-date, and FREE,
desktop for Atari computers in the future ??!! This could be important in
combination with the development of FreeMiNT and XaAES. THiNG is not free
but shareware, it's beginning to show it's age, and development has
stopped. (If we're lucky a version 1.30 might be released one day, and
that will probably be the end of it - if I have understood correctly).

Eek! That frightens me, Barry. I had my TT upgraded with a HD floppy drive some years ago: no problems -- yet -- but then I back up my important files twice, on separate disks.

>Before fitting an HD floppy remember that if your ST fails you
>will not be able to access your data until you have it fixed unless you
>have another compatible machine.

Unless of course you have an external B drive (DD), as I have and recommend.

BTW don't reply on backing on to another external hard disk: my one blew up last week with an enormous cloud of white smoke, even after the local repair shop said there was nothing wrong with it -- he could read it perfectly on his PC.

C'est la vie :(
Charles.

Teradesk's most appreciated aspect is that it is small fast simple and compact.

My intention is to keep it that way. (Because I like small fast simple and compact)
I only make sure it looks modern and works well with modern MiNT,TOS,XaAES and MagiC.

I would like to reserve the name 'Teradesk' for such a version and the
name 'xa_desk' for a even more compact version for XaAES.

Anybody who wants to make a KDE out it is free to do so. Thats what GPL is for.

Ah, Charles. I think what Barrie was saying is that the HD floppies that fail are the ones formatted as DD. TTs and MegaSTEs fitted with AJAX chips should read/write HD disks just fine as they were made/designed with HD floppy drives in mind. (same with the Falcon).

So don't worry about your TT with HD drive and floppies..

>>Ten years experience with customers says stay away from HD floppies. 90% of
>>failed discs are HD.
>
>Eek! That frightens me, Barry. I had my TT upgraded with a HD floppy drive
>some years ago: no problems -- yet -- but then I back up my important
>files twice, on separate disks.

Matthew,

I hope you're not going to leave the myatari.net staff, are you? It just seems like an awful lot of work (to me at least) to maintain two web sites and a monthly magazine.

Later, Phil

Thanks Joakim, the download works as you say :-)

I also left a message about the faulty download via the TOPP website FWIW.

Cheers

Derryck

>
> Hi Mark

we had a lovely time today. Bill has been having problems with
Gemulator..after trying every possible combination, it turned out that we
were using a "bad" tos image. Once we located a bed image, it worked like a
bought on :)
and finally, we were able to get Saint running..it needs Direct x and
although I have it on my PC, it looked as though we didn't have it on the PC
Users group PC...so we installed it and like Gemulator, she worked.Its a bit
fiddly to use but doesn't bomb much..

my question is, it uses .st files........is it possible to make a prg such
as Word Writer into a .st and then use Word Writer in Saint. The only
Makedisk we had has to used via DOS...is there a shell exe anywhere ??

>article list below. What the fuck does "Mac OS X Update News!" have
>to do with Atari? Someone enlighten me please...

You must be a first-time reader!! Not a problem - we're always glad to have
more.
Actually, there is more than one Atari-related item in that list. And there
are other Atari-related items that weren't highlighted there.

A-ONE is not, and never has been, solely an Atari-specific online magazine.
While we would relish the idea of it being so, there's not enough Atari news in
the world today to be so. The staff has its roots with Atari machines and we
all still use them regularly. But we know that most Atari users also use other
platforms and are interested in general computing and technology news, with
gaming as an extra feature. We try to keep our readers up-to-date on the news
of interest as it relates to computing. If you're not interested in that, then
A-ONE isn't for you. We have hundreds of other readers who are.

-Dana @ A-ONE

3447. Hardware giveaway (Stacy, Mega2, others) - Yorkshire, UK

Newsgroup: comp.sys.atari.st
Date: 2002-11-17 16:14:18 UTC
From: Jaimie Vandenbergh <jaimie@usually.sessile.org>
Message-ID: <t0bftugfvnrqhu9smjd1l0428svki1djrf@4ax.com>
Source record: 31007

Hi all -

I've had a pile of ST hardware dropped on me, and having no time to play with it I thought I'd pass it on to anyone who wants it - it's free to a good home. Don't bite me, but I was more a Sinclair and Amiga kid when this stuff was originally current, though I did have an 800XL too!

I'm near Bradford, N Yorkshire. Collection very much preferred, given that it's all bulky delicates - it'd take me hours to parcel up, and I'll bill for that time...

Not much in the way of cables/mice/joysticks, but there are free coffee stains etc. It looks like much of it was in hard use up to the original owner's sudden demise, poor chap. I'm sure he'd like to see it go to someone who'd appreciate it.

Here's the kit:

* Stacy4 - All the goodness of an ST, as a laptop. Well, it's a bit hefty for laptop, but certainly portable for those who still gig with an ST doing the MIDI. I don't know if it works, it needs an 18v 2A PSU.

* 520STE F - Might be dead, doesn't wake up the monitor but lights the green "on" light.

* 520STE F - Comes up okay, reads floppies.

* 1040STFM - Comes up okay, reads floppies.

* SM124 mono monitor - Not a happy device, top few lines of pixels are scattered down the screen, and the picture's too small. The usual too-old-monitor effects, easily fixable if you know how (apparently).

* MegaST2 - Comes up okay, reads floppies. Main box, mouse, keyboard (missing */ from numberpad, 520 ones don't fit but could be adapted easily).

* Megafile 30 - When plugged into the Mega2, shows AHDI v3.00 Apr 11 1989 and then three bombs. Doesn't continue to boot, and I don't know if it's software bitrot or hardware failure. The disk spins up and selftests, though.

* Pace 5.25" floppy drive, no PSU.

* SuperCharger by Beta Systems - "Der PC-Emulator" it cheerfully explains on the box. Looks like a little hardware 8086 device ("Mit

1MB!"), connects by DMA cable. There's a manual! Less fortunately, it refers to three utility disks none of which are here. Bah.

* Supradrive FD-10 - not 100% sure what this is, it's got a 5.25" floppy disk slot, but a DMA interface cable with "10mb supradrive" scribbled on it. It's also got a DMA passthrough type socket, and a DB25 female on the back, unlabelled. Seems to work as a floppy drive...

* Third Coast Technologies external hard disk enclosure. Fires up fine, but the MegaST2 doesn't notice it when I plug it directly in. These last two seem likely to be adjuncts to the SuperCharger, I guess.

Misc - one (!) DMA cable, and a printer cable.

Oh, and Easycalc and Scrabble Deluxe. For some reason I've not got a huge pile of floppies, we don't know what happened to all the software.

So, anyone interested in coming and getting it? If it's not gone soon, it's going to get skipped. And please don't pick and choose - take the lot, I need the room!

I'll try and keep up here, but I'm just passing through so email will likely get faster responses.

Cheers - Jaimie

> >OK, did I miss something here? I see one Atari-releated item in that
> >article list below. What the fuck does "Mac OS X Update News!" have
> >to do with Atari? Someone enlighten me please...

It is part of the tech industry. The personalities, history, laws, markets, trends, and users all have the same roots. Many (hopefully most) of the old Atari employees are still alive and out there doing great things with computers and companies.
Since there is no actual Atari company making computers anymore...only reporting on Atari products doesn't leave much to report.

One reason I've always enjoyed Atari, is because it seemed more about people than machines. Atari never really put much into software R&D for the 16bit computers. Instead, they relied on third party companies and individuals, and often worked with publications and such to give them what I'd call "Rock Star" personalities. I.E. I've never seen anything quite like the Manuals for old Dr. T software (which came out on several platforms btw). It's difficult to explain, but the entire experience was very personable in comparison to the competition of the era (such as CakeWalk for the PC). The software was designed that way...and the manuals touted life itself. With Atari, it always seemed about people, the little guy with some hope or dream to accomplish using a set of tools. Manuals had educational material at large, rather than just about software features (I.E. PageStream's manuals give tons of useful insight on publishing at large. To this day, I still use PageStream in schools to teach printing and publishing terminolgy that simply has never been explained so well in a single publication.). They often talked about inspiration and pitfalls for the software, and sometimes even went so far as to build a kind of legacy into the products...such as naming a feature or bug after the author's new kid that was born between line 8000 and 9000 in the code.

What you have to remember...
The entire gaming and personal computing industry all started in the same place with a hand full of personalities and small burst of venture capitol. It makes for a much more interesting publication to report on industry happenings at large. It's also nice to see some that focus more on the PEOPLE than buttons and gadgets. Check it out, and maybe you'll see what I mean. A-One is very much like the kind of discussions you might hear if a handfull of Atari old timers were to gather at the local pub next Saturday for a beer and chat. It's about the people man.

> You must be a first-time reader!! Not a problem - we're always glad to have
> more.
> Actually, there is more than one Atari-related item in that list. And there
> are other Atari-related items that weren't highlighted there.

Indeed...
I recently signed on and have recieved two issues. I find them very interesting and informative. They're also FUN, and obviously about PEOPLE. Keep up the good work.

Brian

Hello together,

Maybe someone can help me out here: I'm currently searching for Juergen Piscol, the one who created the music for MidiMaze II. Does someone know an address how to contact him? I need a contact adress because I want to use his music for WinMaze (www.winmaze.de), but I can't remix from Juergen Piscol without asking him. So, if you know an address, it would be very nice!

Nils

3451. New on TAMW: New beta version of Pulsar Available.

Newsgroup: comp.sys.atari.st

New beta version of Pulsar Available at TAMW (Tims Atari MIDI World)

NEW! NOV 2002. Neil has made another beta version of PULSAR (which brings us to version 2.14.) This was at my request to increase the tempo limit which can now be set to 999! This means you can create nice fast sequencer effects. I have also included some new PULS in the file, one of which is the sequence used by Pink Floyd on their "Dark Side of the Moon" album and the song : "On the run". (thus the file is called: "ontherun.pul")This featured an EMS Synthi AKS doing a very fast sequence, which now you can replicate using Pulsar! Another neat trick is to program a nice up and down scale, then speed up the tempo, and then use the transpose keys to "play" the arpegio effects in real time. Feedback is appreciated.

3452. Sample transfers: thank you

Newsgroup: comp.sys.atari.st
Date: 2002-11-17 21:23:54 UTC
From: sonik@whsmithnet.co.uk
Message-ID: <3dd808ea_3@news2.vip.uk.com>
Source record: 31012

Hi folks

I'd like to say a big thank you to everyone who has either sent me programs or links to programs to overcome the problems I have faced with trying to transfer WAV samples over MIDI to my sampler.

I happened to drop a line to Danny McAleer (former head honcho of superb Atari MIDI software house Electronic Cow) and he advised me to give one of his programs a try by the name of Squash-It!. I downloaded it at his site (www.cow-net.co.uk) and it does the business good style.

As well as sending WAVs, AVRs etc over MIDI, it is a fair bit like Zero X in that it can manipulate the samples too so you can reverse, cut, copy them etc and it comes with a load of processing tools built in including digital delay building, ring and phase modulations, chorusing etc. Dead useful.

All the Leccy Cow stuff is now freeware, can be downloaded straight from the site and the printed manuals are just a fiver each. I think there are links to it from both Tim's fine portal and the Atari Launchpad. By the way have you noticed how many dead links there are from the Launchpad site?

"This week, I will be mostly using Squash-It!" Suit you, sir....

Al

ps cheers to Jos in Holland, Tim Conrardy and Danny himself

I think it bloody excellent but in the emulation page, I didn't see mention
of gemulator, Winston.Tosbox or SAINT. A lot of the links seeme dto be for 8
bit...nothing wrong with that.....

what would be wonderful would be a list of addresses of all the Atari clubs
about the world
cheers

To: atari@aracnet.com
Subject: Howdy Doody Ben!

This is how it works Benny Boy...
You can either stop posting anything related to Bravo Sierra or we can continue
to make a mockery out of everything you post. It's very simple.
When you stop, we will stop. That includes all the retards posting in your
favor. You have various other places to post your useless spam so you determine
what the best way to go is. Stop posting your adverts on the newsgroups or
we just keep causing a tremendous amount of trouble. As you can clearly see,
the atari newsgroup is nothing more than a warzone and we are able to post
as you using your very own topics. Everyone is going off topic and it's because
of YOUR postings!

Simple deal Ben. When you stop, we will stop. Everyone wins the very moment
that you quit posting advertisments. Make no mistake about it, we haven't
been kicked from any emailing service or remailer and we will continue as long
as you continue to post adverts.

We are prepared to stop *right now* so long as you stop posting *right now*.
Upto you. How do you want to play this out?

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/
Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.atari.org or at
http://BenSells.atari.org Catalogs can be attached to,Requested by & Received
Through E-Mail at atari@aracnet.com or BenSells@atari.org and Please Specify Atari 8 Bit,
ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Hi all,

up until now, I have been looking a bit bemusedly on the whole discussion about Ben's adverts. The solution which seems to be reached (the ADV: in the advert headers) seems to be satisfying the majority of regulars here by making the posts even easier to ignore.

For me, sometimes I view them, and sometimes I ignore them; the Bravo Sierra sender is indication enough for me.

This latest message to Ben, however, shows that some individuals do not know where to draw the line of what is viewed as 'acceptable behaviour' by most people.

It seems like these days, if someone seems something (s)he doesn't like it isn't sufficient to simply ignore it.
No - it has to be stamped out, deleted, eradicated and the individual responsible threatened or cowed into submission, at any price. * Sigh *

In this case, some sad git has seen fit to threaten Ben, which I think is completely over the top in relation to his alleged wrongdoings. Moreover, I suspect the one responsible knows that his/her actions are not acceptable, hence the fact that the message has been sent anonymously.

I think that if someone is truly offended and takes appropriate measures, they should be doing so in public, or at least under their own name. To do it like this is far more despicable as anything Ben seems to have done. Furthermore, I haven't seen any indication that Ben responds to dissenters with threats or somesuch... He doesn't seem dangerous to me.

Well, I could go on for a few more paragraphs in this manner, but I think I got my point across now without too much namecalling. Feel free to disagree, I'd say, and let me know what you think.

To Ben I'd like to say: I think that a lot of people on both sides of the argument don't agree with the practices shown in the message to you.

On a more personal note: my dealings with Ben have always been pleasant and he seems to me like an honest man, even telling me about customers who are or were not satisfied with his service. He has my support !

To the sender-of-threats I'd like to say: who appointed you as defender of the content of csa8 ? And why do you think you can speak for us all ?

Kind regards to all,
Wef Dinaini

PS: Yeah, I know the return address on this message bounces, so I'm also posting anonymously, in a way. A number of regulars here (waves to Fox & Mathy) know who I am, however.

I don't remember who it was, but at first the person
complained with a name. That might tell who is
harassing Ben. At least Ben's ISP has said Ben
can continue his ads. I don't pay much attention
to Ben's, or Dean Garrahty (sp wrong), actually, as
I'm not looking for anything right now. I appreciate
Ben telling the group about this, and I hope it
clears up and the harasser quits.
I'm one of the 'retards' that support Ben's reasonable
and on topic posts about 8-bit stuff. If he was selling
ST or some other off topic stuff, that would be different.
Ben is a contributor and participant, which is important
to me. (Well, he also sells ST stuff.)
The 'we' in the threat message isn't a 'we', it is a 'me'
only one person can send an e-mail.

The sender of these anonymous hate postings and e-mails to Ben, AKA "Bravo Sierra Computers" does indicate the individual has sociopath tendencies and though carries a tone of threat in the messages is more than likely too cowardly to act upon serious action. I would guess the individual has few friends. S/he (more than likely a guy 22 to 24 in age but there are pointers in the messages that there is a deep desire to be a woman). And though an adult in years is childish in inter-personal skills. S/he uses this form of annoyance to gain attention. Somewhat like an only, lonely child. We would better serve the individual with pitty rather than anger for "Percy" is in need of help.

I've nick-named the individual "Percy from the Green Mile". Seems fitting.

An interesting subject. I hope to get an "A" in my Sociology course.

Is it just my impression, or is the amount of traffic on comp.sys.atari.st way, WAY down? I hope it isn't my newsfeed that is failing to pick everything up.

If I'm right, and the level of traffic is down, then either Ben's weekly posting and the accompanying deluge of flames is (partially) at fault, or it is not. I do not personally believe that the Bravo Sierra advertisement is driving loyal or potential Atarians off the newsgroup. If it is not at fault, then, we should welcome even a weekly advertisement from any of the surviving vendors to bolster the dwindling traffic on the newsgroup. Only those with a self-destructive axe to grind about the purity of the newsgroup topics should have anything to complain about.

I am also a TI-99/4A user. I notice the comp.sys.ti newsgroup is basically dead. In this case, it was the migration to a private mailing list that killed the newsgroup. I would be absolutely delighted to see ANYTHING show up in the TI newsgroup, even a weekly advertisement. Do people really want to see comp.sys.atari.st end up like comp.sys.ti?

Hi

I'm not having a good week:(((first 2 of my 6-cd changers cd-rom drives
gave up the ghost, and now my external 5.25 drive has decided to part
with it's drive heads:(((so it's now 'skip fodder'.

So I'm after a replacement, either a cumana duel (3.5 & 5.25) of a
single unit.

I'm in the UK:)

thanx in advance

Hi all

I've had dealings with Ben in the past and as far as trading with Ben I have no problems and will more than likely trade again with Ben in the future.

I've always stated that, it's just the overdoing on the advert posting front that's a tad annoying.

I tend to read, again, posts that are for selling, wanted or trading/swapping (amongst others) and it does get a little repetitive if you are reading several postings with the SAME content but different subject.

I dont believe in threatening people, if it was the posting that was annoying! Make a comment about your displeasure and get on with your life (if you have one).

Hi Steve,

> I've always stated that, it's just the overdoing on the advert
>posting front that's a tad annoying.

Quite, that was my view too.

I kept out of the recent arguments about this though (what's the point, after all, doesn't your newsreader software offer filtering facilities?) and I thought that the compromise that was reached was a very good one.

Everyone seemed happy with the situation. So *WHY* has all this kicked off again now?

Personally, and without pointing any fingers, I think that those individuals who started posting Bens' advert for him need to take a large share of responsibility for this....considering how emotionally charged an issue this seems to be, the *ONLY* possible result of doing such a thing would be to stir everything up again. Which seems to be exactly what has happened! :-(

Thanks guys.

Now, can we PLEASE leave Ben alone to do his thing (and let him post his own adverts, he doesn't need our help).

> I dont believe in threatening people, if it was the posting that
>was annoying! Make a comment about your displeasure and get on with
>your life (if you have one).

Absolutely, that is COMPLETELY out of order. Obviously the child has nothing better to do.

TTFN - Pete.

I guess many people here know that I don't have Atari hardware for several years now, and I do all my 8-bitting in emulation. (If you didn't know it, you just found out <G!>) But if circumstances were different and I still had my hardware, I'd be happy for any reference to retail sources of hardware and/or software for my Atari no matter if it happened to be an advert submitted by the retailer, a reference made by another poster, or something in snail-mail. It's getting pretty tough to find anything Atari these days unless you're "in the know."

So, my advice can be summed up in three words:

PLAY NICE, CHILDREN!

Take care.

Alan

This utter non-sense has gone on too long. I dont like Ben's adverts myself
but I dont have to read them. The idiots that are annoying Ben with
anonymous posts & emails, and are spamming this newsgroup with various
crap should definately 'GROW UP!'

Get a life people, if you dont like Ben's posts, DONT READ THEM, like
I dont.

I appreciate Ben is one of the last Atari suppliers, and good on him for
sticking with it so long. I wish him well. His posts dont harm anyone,
unlike the childish dribble from some reject with too much time on his
hands.

Holmes

> Why not change the name than? The once a week news is already old.
> news.com is updated by the minute, hour and day. Just point and
> click..

This may be true...
But...the entire presentation is very different...
There is nothing personable about news.com.

1. My understanding is that A-One is NOT a news paper or news broadcast. It's an Ezine with a very flexable format. It may have a news orientation some issues...while others might be more 'article' oriented...depending on what is avilable at publishing time, and how the folx working on it feel at the time.

2. It sometimes includes a condensed selection of news headlines that might be percieved as 'of interest to the Atari Community'.

3. It doesn't cost anything...hence the polite thing to do is allow the Ezine their creative lisence and simply enjoy it for what it is.

If you haven't read it...you would not understand.
This goes back to the same spirit mentioned earler in this thread about the way Atari was done over the years. Real names, and real daily life events. Real PEOPLE connections. Not some faceless ticker tape report from a weblink...

This style of presenting "Articles" may not be for you...nothing forces you to subscribe to it.

> Must be a labor of love using the name of a defunct computer company..

Perhaps that's exactly what it is?
Consider it something like this...
An Atari user club sitting around sharing the Times...

Perhaps it's silly to some...the idea of fraternity, which is in essence any common bond shared by a group of people. Sometimes it's not much more than greek letters, or some crazy ritual. In this case, it's the Atari Fuji, and it's simply rooted in the experiences of previous or present Atari owners/enthuists. If it's not your thing...so be it! There are folx that rather enjoy it none the less.

Brian

Just bought a mega4 and would like to program it. Does anyone have some
pointers to where to start, like compilers, debuggers, standard libraries,
which language is the most common... All suggestions are welcome.
Also I wonder if anyone has connected a SCSI drive to their mega?

If you want to write programs in C I advies you Pure C

But if you are going to learn programming, I advise you GFA-Basic.

I have no beef with Ben, but its stuff like that (either Ben or the people who pick on Ben, won't say & can't say) that is tearing this group and the community apart. I, myself, have offered Ben a simple solution: http://groups.yahoo.com/group/atariswapnshop but he chooses to ignore. oh well. don't get me wrong, I have no problem with Ben advertising on usenet (sometimes I wish B&C or Best Electronics would advertise as well) espcially since he is one of a few atari dealers left but I think we all need to do our part and ignore the trolls. I've seen this sorta thing go on in other news groups (such as alt.comp.freeware) and everyone over there agreed that when you do make a group effort to ignore the trolls then more likely they'll go away. They know they are pissing Ben off. They won't go away because he keeps acknowledging them. It goes both ways. Holmes has the right idea, if you don't like Ben's adverts, then skip over them. Come to think of it, no one is saying much about people who post links to their auctions on ebay, are we/they? Maybe Ben ought to consider selling his stuff through ebay? :-\ Just a suggestion. This newsgroup certainly isn't as active as it used to be for his adverts to take up bandwidth (esp. when I'm positive a majority of us have more than a 56K connection, at minimum). But trolling and feeding the trolls take up as much if not more bandwidth than Ben's adverts.

So, here I go once again pushing my yahoo group:
http://groups.yahoo.com/group/atariswapnshop

But these are my opinions. Whether or not you take them with a grain of salt is your choice. :o)

I ran a BBS with a Mega ST4 and at one time had three SCSI hard drives and a SCSI Syquest drive connected up. You need the SCSI drives up and running before the ST boots. With a little program on a floppy which was always in the A drive all I had to do is throw one switch and the program would hold the ST from booting until the SCSI drives were up to speed and then the ST would boot (from the C hard drive). I still use SCSI in my computer but now use a home built computer using Windows 98 SE. BBSing is fun. Kinda miss it at times. I had the Bear Cavern BBS in it's final 4 or 5 years.

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware: AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video8.zip (160 Kb).

VDI/AES:
- Restore/save palette even in True Colour modes.

XBIOS:
- Bugfixes in Milan MVDI support.
- Added preliminary support for Videl Inside (Falcon).

Sources are available:
http://membres.lycos.fr/pmandin/download/src/cleancode-0.8.tar.gz (90 Kb).

> Later, Phil

Hi Phil,

Doni¿½t worry, I have no intention of leaving MyAtari! I am extremely proud of MyAtari magazine. From my initial ideas (back in Summer 2000) and thanks to the contributions of its writers and the support of its readers, MyAtari has become what it is today.

I will be honest though, MyAtari does eat up almost all of Shiuming and my free time (it is our readers support though that keeps us going) and it can sometimes be difficult at times. However, ATARItoday is mostly automated (using custom perl scripts that I have written) which should make maintaining it relative easy. ATARItoday was really developed for selfish reasons really, I simply found it too time consuming to browse all the news sites and just wanted a single site I could visit to read the headlines and it has developed from there.

Thanks for your input. If you or anyone else is able to help out with ATARItoday, I would gladly welcome it!

Matthew

That should not happen. There is no reference to that name anywhere outside btst.s

Hi Derryck,

That must be a different web page than those I saw. One says that Rom-
Logicware has, if remember aright, ceased trading; another - I forget
which - has their remaining stuff for sale, but Papyrus is not on their
list. I was shocked and saddened.

If I have misunderstood, please correct me energetically and I will
apologise without restraint. Indeed, I am sorry I posted in the first
place.

I'll try the web pages again tonight.

Cheers,
Charles.

Hi,

> I have no beef with Ben, but its stuff like that (either Ben
>or the people who pick on Ben, won't say & can't say) that is
>tearing this group and the community apart....

This bickering will only tear the group/community apart if we allow it to!

IMHO The simple solution is to just ignore the cretin(s) who are stirring things up by posting these anonymous messages. Eventually he/they will get bored and go away.

>....I, myself, have offered Ben a simple solution:
>http://groups.yahoo.com/group/atariswapnshop but he chooses to
>ignore....

Unfortunately, a mailing list like that isn't really going to reach the majority of people that Ben needs to reach. :-(

>....Come to think of it, no one is saying much about people who post
>links to their auctions on ebay, are we/they?....

Possibly because those of us who find them to be a problem simply filter them out/ignore them?

>....Maybe Ben ought to consider selling his stuff through ebay? :-\

Please NO!!!!

>....But trolling and feeding the trolls take up as much if not more
>bandwidth than Ben's adverts.

Agreed, so can we all get back to chatting about the important stuff!?

> Also I wonder if anyone has connected a SCSI drive to their mega?

What sort of programming do you have in mind?
Is there any language you already know/use?

Here's at least one free set of tools...

One thing to definately take a look at is a thorough MiNT set-up with gcc.
The EasyMint distribution, for example, is free, and it comes with a pretty
comprehensive set of libraries for coding in Ansi C for a unix environment, as
well as libs for working with GEM, Xwin11, and more. If you are a newbie at C,
it may be a good place to begin, as there is an abundance of free tutorials and
example code out and about for platform independent screen based coding. Such
code is often platform independent...it'll compile on almost anything!

MiNT allows you to set up and use a variety of shells/environments for working
with your code. Bash, sh, tcsh are examples that are fairly standard on all
platforms. Learning your way around these shells is a definate plus for a
programmer.

Also for MiNT are engines for pearl scripting...another very useful
quazi-programmer's tool.

Once you move into specific Atari goodies like GEM (let's open a window, make
the background white, initalize a vt52 emulation inside, set some text colors,
change the mouse cursor, and use a font to put some text in there), you'll
likely find yourself wanting some kind of lexicon for Atari's own GEM, TOS,
GDOS, VDI, and the list goes on. I'll leave this to people who know more about
it!

Yes...hooking a SCSI drive to a Mega 4 requires a host adaptor. The device
plugs into the ASCI port on the back of the Mega, and then it accepts standard
SCSI devices. Look for something as current as possible like the Link 97 if you
plan on using drives 1gig or larger, and other more modern SCSI devices.

You'll also need driver software, and there are a number of options.
HDDriver
ICD Pro Tools
SCSI Tools
CHBD
AHDI
More...

I personally recommend HDDriver because it is the most up to date in many respects.
1. More devices supported...Jaz, Zip, SyQuest, LS, etc...
2. Support for more partition types of large sizes (BigDOS, GEM, BGM).
I.E. You could format a Zip disk that is happy on BOTH your Mega and PC.
3. SCSIDRV support, allowing software to communicate with the SCSI bus in a clean/standard way. I.E. The Dynalink SCSI ethernet adaptors.
4. Background DMA with MagiC.
And the list goes on....

For CD and CD-R devices there is:
ExtenDOS Gold
Spin
More ??? ...

Wizztronics in the USA stocks new Link 97 hosts and HDDriver.
There is also a good chance that other US suppliers may have something in stock as well.

Atari WorkShop in the UK usually has hosts and driver software in stock.

Hope this helps...
Brian

Ah, I see - I'd assumed that you'd gone to R.O.M's home page itself and
garnered this. It's still the same info that was there (re the credit card
info) a couple of months ago. They never kept it updated very often anyway.

>If I have misunderstood, please correct me energetically and I will
>apologise without restraint. Indeed, I am sorry I posted in the first

I don't have any insider info about this situation at all, if you come to
any conclusion I'd be glad to hear it! Post away... :-)

Cheers

Cheers

Derryck

Hi David,

>Is it just my impression, or is the amount of traffic on comp.sys.atari.st
>way, WAY down? I hope it isn't my newsfeed that is failing to pick everything
>up.

No, sadly your impression is spot on... the traffic in CSAST is way down :-(

>If I'm right, and the level of traffic is down, then either Ben's weekly
>posting and the accompanying deluge of flames is (partially) at fault, or it
>is not.

IMO his weekly spam has nothing to do with it, he's been spamming here for
years, just like the incidental accompanying flames have been here for years.

Has it occured to you that a lot of loyal posters are fed up? I for one hardly
post here anymore, I rather help someone out by personal mail. It saves me from
being flamed, insulted and having to defend myself in yet another meaningless
thread. Anyone who dares not to "admire" and walk the path of a few individuals
that declared themselves "the keepers of the flame" clearly isn't welcome here
anymore.... What's the use of a public forum where someone can't express his
personal views and opinions on a certain topic without risking his nose being
bitten off ?
I restrict myself these days to replying to posts like "help, my mouse doesn't
work anymore"... and to play it absolutely safe I reply by PM. If it would only
be me who acted like this then it would go unnoticed but unfortunately there are
quite a few loyal posters now who act like this... and it's beginning to show.

>Do people really want to see comp.sys.atari.st end up like comp.sys.ti?

Apparently :-(

Cheers from Belgium

According to the definition I found, spam only applies to e-mail and not subscriptions to news groups.

http://www.auburn.edu/helpdesk/glossary/spam.html

Or did you mean to write "Ben's mail isn't intself spam,"

Hi DOn

Since it isn't actually a dictionary recognised term then your definition
isn't really relevant, I define spam as being anything that's of an unwanted
advert nature.

> According to the definition I found, spam only applies to e-mail and not
> subscriptions to news groups.
>
> http://www.auburn.edu/helpdesk/glossary/spam.html

> living.
>
> Its against the rules, hence off-topic.

First, I was under the impression (and I guess I was right by what someone else said in another post) that Spam only applied to e-mail, not newsgroups.

Second, giving out e-mail addresses (a private communications venue) to spammers is in no way the same as posting an advertisement to a newsgroup (a public forum). Anyway, I wouldn't mind terribly being put on a mailing list if it actually had something to do with what I'm interested in, like Ben's ads have to do with the Atari community.

Third, other people use newsgroups to advertise Atari items they have to sell. The only difference I see between them and Ben is that he is trying to make a living by it (a feat in and of itself), and posts more frequently (which I don't personally see a problem with).

Fourth, even if it is against the rules, that doesn't make it "off-topic". It has everything to do with Atari machines (as that's what he primarily sells). Please tell me how this is off-topic.

Finally, the point of my post was not to say, "Everyone must agree with and accept Ben's posting, and submit themselves to off-topic spam". I was simply pointing out that while Ben's posts can be offensive to some people (yes, I was actually allowing for your point of view), the obscenities in the idiotic spoof presented as a response to the post was absolutely uncalled for, offensive, destructive to the community here, and off-topic, even more than Ben's ads.

As for the ads, if you don't like them, ignor them. If you can't ignor them, set your newsreader to filter them out. If you can't filter them out, deal with them. I don't see how they can hurt you in any way. They may actually be helpful to some of us here, and help support the Atari community as a whole through offering people wanting to purchase something for their machine a place to do that, while supporting a fellow Atarian's career. I think that's much more vital for the survival of the Atari community than

going around bashing each other like this.

Well, if you mean spam-bots that spits out Atari information, put me on a
list, but else you can ... (you know the rest)

Ben's posts IS Atari related and I appreciate to know who still has stuff
for sale. I wouldn't have been able to order Dean G.'s CD's if he didn't let
us know here, so I appreciate those ads. Just keep them Atari related.

I use GFA for more than ten years and be happy with it.
For faster routines I use assembler.

Hi James,

this "Terrorist" claims it has not been kicked off of any e-mailer/
re-mailer service. Could he been lying? This Gutless wonder is just like
the Terrorists in the News. Except those Terrorists claim responsibility!
And they die and go to Paradise with their Virgins. This Particular
Terrorist will Die and go to Hell and be Satan's favorite Sex Toy and be
regularly abused. This "Terrorist" Claims Anonymity. But most of us are
sure who he is. Who else has protested so much, hounding me to the point
of absurdity. All because he hates/loathes my opinions. Stand up for FREE
SPEECH while you still have it. Before you lose the right and privilege!

===Ben===

> Now IT's gone to another remailer. If anyone that twit abuses brings it

3522. Re: Papyrus is NOT dead

Newsgroup: comp.sys.atari.st
Date: 2002-11-21 16:51:52 UTC
From: Ulli Ramps <Ulli.Ramps@rom-logicware.com>
Message-ID: <3DDD0F28.3167D355@rom-logicware.com>
Source record: 30981

Hi there, short notice to clear things up.

Not a very clever posting, Charles X-).

First, R.O.M. logicware is fine and growing, we didn't have any problems in general, but in detail - only with the English version:

As I already told on our homepage, the highest court of Germany decided to place the credit card companies in duty for all business between the dealer and the customer - which of course is horribly silly.

As a result, the main credit card companies (VISA, Mastercard, ...) found this as silly and stupid as we do and quit every contract with long distance dealers in Germany, like we are.

What made us freeze our English language business somewhat, because there is no clever way to get our money, any longer ...
"Freezing" means, that we didn't force the translation files for Papyrus 9, but they are nearly through, only some days for the finishing - but if it would be ready for release, this would increase the problems, because what to do then? How to sell?

This funny farm decision of our highest court has stopped our foreign language business for months, now. And still does. Great, huh?

The situation's still there, but some in-between-financial-companies promise to find a way to take the risk and to allow companies like us to take credit card orders, again.
We nerve them somewhat daily, to give us new credit card contracts, so I expect us to be able to take orders again, in some weeks.

We have to be able, because there will be an English version quite soon for sure:
We will release an Apple Macintosh native version of Papyrus (for MacOS 9.x and X) within the very next weeks, hopefully before Xmas, and of course we really would like to sell it outside of Germany, as well, somehow ...

Nice greetings from Germany, the funny farm in international trading

Ulli Ramps

R.O.M. logicware

P.S.: Please have in mind - I don't read this group daily, only from time to time.

I agree. I've talked to Brad at Best Electronics and Lance at Video 61 and
advised them to run some Holiday Specials. I don't think of it as
competition. We Dealer's have to much in common and regularly refer
Atarians to other Dealers when we don't have what they need. We believe
it's better to keep them happy rather than have them abandon their Ataris
because they cant get their Atari needs fulfilled.

That is pretty much what I think too, no way I'd buy from someone this ignorant.
But I also know there is no point in keeping threads going about this particular
"retailer", as he only spams the group, he doesn't read it.

Oh well..

So, I guess that means you think TV advertising is SPAM? What about
radio ads? Or magazine ads? Is all that SPAM too?

I think your definition is far too broad and not one that would be
accepted by those on the internet.

He does not spam any newsgroups! Learn about how news works before you speak!!

Spam is unsolicited mail or possibly when multiposting to lots of newsgroups.

Ben is perfectly on topic! His posts are about Atari computers etc.

There is no charter for this group as far as I know that prohibits the kind of messages he posts!! Probably simply because it has been around too long.

Those who are off topic are those who keep complaining to the group that they don't like Ben's posts. This is always considered bad behaviour. What happens is:

1. Other people (like myself) get upset by the responses.

2. The original poster (Ben) simply must go on and perhaps post even more.

The only working behaviour is:

1. Ignore Ben's posts or filter them!

2. Complain to him personally by e-mail!

3. Complain to his ISP if you like.

In my eyes Ben is the victim of a mob. I personally stand up to Ben's defence and hope lots of others do the same!

I guess it's time for us all to show our support by ordering something from his business!!

Unwanted by whom ? I am not a big fan of all the junk in my email, from Hong Kong, or whereever, with porn and shit. But I do want Ben's ads, so who is to say if it's spam or not then ? And why is your definition better than the others ?

Hey,

I was watching Country Music Telivision and I was listening to a Video, I think it was called "1980 something" and when I looked, I caught a glimpse of Kids playing an Atari 2600, showing the Console and Joysticks on home movies! Brings back memories.

That's fine. I do Business with and support other Atari Dealers like Video61, Best Electronics and yes even B & C ComputerVisions. Atari Dealers are like a BrotherHood. We help each other out. All I ask is my Share of the Atari Customers. I don't need Terrorists like the one who's been hounding me mercilessly, all because He Hates my Politics. No FREE speech here! The Kicker is, I checked and B & C has no record of ever selling to Him. What a Hypocrite! I believe he only does Business with Pirate Sites!

Oh, BTW, when complaining about my Posts, maybe you should delete my Ads from your posts. Since you find them offensive.

I would like to spend more time in the NewsGroups, but with the Mob Mentality, infantile behaviour, plus it gets so depressing seeing people Advertising Atari stuff for sale. When I read the Sale Posts, I discover it's for auctions, plus I'm persecuted for trying to professionally support the Atari. Not making enough to pay my Bills.

I believe most who have decided not to buy from me have Pre-Judged me. Another word for Prejudice. Most of you have not given me a chance to serve you.

Those who want to crucify me over spam need to evaluate this on a case by case basis. Judge me on my merits, not on a one-size fits all. Dont throw out the Baby with the Bath Water!

If I could, I would spend more time in the NewsGroups. But Not only does E-Mail keep me busy, I have responsibilities,like acquiring new inventory, Testing New Inventory, Cataloging and Pricing New Inventory, Updating my WebSite, and putting my Inventory in my WhereHouse. I have to process incoming orders with a less than 24 Hour Turnaround, Maintain my Catalogs. My Workspace has Boxes and Crates of Inventory I haven't processed, since I need to process it all, I can't store all my Inventory.

You try being one of the last of the Atari Dealers still Advertising. It's not like they don't need the Business. They just don't want to put up with the Mob Mentality, like I have. Not once do I get a reward or even a Pat on the Back.

Never, have my attackers tried to work this out. Like the Biblical Principle. Instead of coming to me to work it out, they RIP-ME-APART

publicly in the NewsGroups where it get's them the most points.

I have dealt with Ben in the past and was amazed with the service he provided. He got me my items in a timely fashion, not to mention he was the only one who I found that had a boxed copy of Captive and a Dungeon Master hintbook. Personaly I don't mind Ben posting his ads here, they are completly on topic. Not to mention without his posts I wouldn't have found out about him in the first place. Keep up the good work Ben, don't let these trolls drag you down. Sadly trolls are a part of every group on the net, just shrug them off and get on with things.

Do you accept Credit cards yet? Or Paypal? That was the reason I
couldnt buy from you the first time, also your prices seem a bit high on
some items. But I'd consider buying from you if you took Credit cards
now.

Other wise, I'll only be supporting those that do.

I do agree, it's a complete waste of time complaining about a particular
message only to repeat it whole in the response!

Have you considered posting only a link to your website? Perhaps that would
be a good compromise in this case.

Cheers

Derryck

The reason it has appeared as you don't read it, is exactly because of
just that. You replying in email. Other may disagree, but I find the
whole point with usenet being to discuss and share things, not using
it as a one-way-street.

Also, to discuss in public is not (at least in my opinion) to "score
points".
I also don't really think we have a "mob" here, merely a couple of
people expressing their point of views. Sure, some aren't doing it
properly (like crappy anonymous emails and stuff) but that is another
story, and I am not trying to justify their methods in any way.

Finally, if you consider anyone disagreeing with your advertising
methods to be part of a "mob", then I understand why you get into
trouble.

Regards,

Joakim

OK, I'm going to tell you a story. And it's true. When I was 15, I dropped out of High School, soon afterward I had an episode, became Hospitalized and Disabled. Currently I'm approaching 39 and not only am I still disabled, but I have other health problems adding to my condition. I've been Disabled for over 20 years and I've been collecting Disability for nearly 20 years. I've been an Atarian since maybe 1980. Most of my rehabilitation is/was through my local Atari Clubs. Part of what I lost, I replaced by learning how to function using my Atari Computers and using the Atari Computer Clubs for support, fellowship and an outlet to get involved and serve my fellow man in the Atari Community as a Teacher, SIG Leader, BBS SysOp, NewsLetter Editor and for a number of years, I've been successful as Vice President of my Atari Club. My President warned me that all unfilled Board Positions, I would have to fill while they were vacant. Lets just say I got quite an education. The Disability I receive is a mere pittance, unable to sustain my most basic needs. Still I must survive, and my skills lie in Atari. As well as what I love to do. It gives me a reason to wake every morning and hope not to give up and go Tango Uniform. I work to stay independent. I don't make a MINT doing this & I can't keep enough in the Bank to Maintain a Bank Account. What I do have going for me is a Family with Land/Homes/Property/Resources supplying me with my Home, Wherehouse for my inventory and facilities to run my Business with. As well as love and moral support. My Father's words stay with me. Don't use Credit Cards as they are a good way to run up Debt. So for myself I have no Credit Cards. The Plus side to this is I have almost no Debt. Still, I need to be Independent. So besides using my Atari Business as my Career, it also serves as Therapy and hope to live and continue. LikeWise, I have Moral reasons not to take Credit Cards for my Business. The old Bible Quote "The Debtor is the Lenders Slave!" On my Principles I avoid Credit Cards. And along with what my Father Taught me. As far as PayPal goes, Since the only Computer I use, know how to use, want to use, own, have and the only Computer I get on the InterNet with is my Atari ST. And when I spoke to PayPal about Atari Compatability, I found with all the encryption codes and other problems, PayPal is not compatible with my Web Browser! And it won't do for me. As far as Credit Cards go, It's more paperwork and more trouble than I need. But then you probably don't believe in Hiring

the Handicapped. So I forgive your ignorance. On, the other hand when a Customer Mails me a Postal Money Order to my P.O. Box, The Post Office will Cash it for me on the spot. And with a quick turnaround, the customers order goes out the same day, usually from the Post Office. And while I'm their, I can mail a Postal Money Order from the Post Office to Pay My Bills. So if you still insist on using a Credit Card or PayPal. I won't hold it against you. And for those wanting to E-Mail me telling me I need to upgrade my Computer to get on the InterNet. I'm not interested. The same goes for my Software and Web Browser. I'm comfortable the way it is. And I'm not willing to change/upgrade my Web Browser to do PayPal.

Hey! Ben,

Don't let "Percy from the Green Mile" bother you.

Here's General Joseph W. "Vinegar Joe" Stilwell's motto with Percy types,

"Illegitimis non carborundum"

Don
Retired SysOp of the retired Bear Cavern BBS.

P.S. At least he signed his message fittingly, "nobody".

Ben,

First and foremost I would like to publically thank you for coming on here and defending your point of view. Perhaps people are pre-judging you but they had nothing to go off of. Sometimes you have to take a risk of looking like (even more of) an ass in order to get your point across.

Ben, Your *business* needs to support credit cards. You attribute your lack of success due to x factors which is plain and simply wrong. I've convidered buying from you but I usually turn to ebay. Why? Ease of use. I can pay with credit cards and paypal.

You don't have to use credit cards yourself, you just need a merchant account and the increased business you get from it should pay your fees. Paypal has no monthly fees but simply a per-transaction fee. Albeit higher than visa merchant accounts!

Therein lies the problem ben. It seems all your life you have been either unwilling or unable to learn to change for the world around you. In most cases that makes sense, but when you try to run a business, YOU have to give in and bite the bullet sometimes. I don't know why I feel like i'm talking to a 2 year old. I would think someone of your caliber running your Atari groups and other such things would know that. Your consumers are a NICE bunch of people that tell you EXACTLY what's wrong. No market studies, no crap. We don't want newsgroup spam and we don't want lack of payment options... and if that means that you have to get up off your ass (or wheel chair (don't know which)) and go out and get a P2-266 (for around $100USD) (because high speed Atari's are a little pricey), so that you can browse paypal and look for an internet visa merchant account, or advertise on local Atari websites, that's what it means. And funny, paypal is neither a credit card nor a merchant account but it does have the added bonus of giving you instant credit card acceptance. But hey.. I'm an idiot and I don't know how to run a business. The customer is ALWAYS right.

Everyone respects your disabilities, though I don't know what they are. Everyone in America understands that disability isn't enough to live on in

this country. But your problem isn't that you CAN'T do something, it's that you WON'T out of pure stubbornness. And frankly, that causes me (and probably other people) to ignore any attached sob stories and chalk you off as a (some 4 letter word).

I've always been willing to respond to you ben. But you'll probably have to go out and get a Winbox (because linux is really really really complicated (laughing)) in order to browse it. Besides. I know for a fact that while CAB doesn't look pretty on my site, it works.

sigh. I don't know why I care enough to respond.

And I will be right there to let you know why Ben is wrong with plain
English reasons that make perfect sense. I won't give up - ever. Not if
htere's only one person committing the crime. Fact is Ben's ISP *DID* have
a problem with his behavior on c.s.a.s.8bit. and limited his posts and
caused him to use ADV. He could have done that on his own for us. But Ben
doesn't care about us. Ben wants our MONEY! And he'll walk on us to get
it.

Hello,

I tried connecting a Falcon to a TT via the LAN port using an Apple
cable and Duet, but I couldn't make it work :-(
Did someone ever manage to have any result using such a cable ?
Please, help me!

Thanks in advance,

J.-Luc

pirate? Sure.

>Oh, BTW, when complaining about my Posts, maybe you should delete my Ads
>from your posts. Since you find them offensive.

It's called proper formatting of a followup. I don't find them offensive,
I do find them annoying.

>I would like to spend more time in the NewsGroups, but with the Mob
>Mentality, infantile behaviour, plus it gets so depressing seeing people
>Advertising Atari stuff for sale. When I read the Sale Posts, I discover
>it's for auctions, plus I'm persecuted for trying to professionally
>support the Atari. Not making enough to pay my Bills.

You are persecuted for being a spammer.

>I believe most who have decided not to buy from me have Pre-Judged me.
>Another word for Prejudice. Most of you have not given me a chance to
>serve you.

No, you've been judged by your *actions*. And as another poster said,
your lack of accepting credit cards or PayPal are two huge strikes against
you compared to other resources for the same merchandise. Why should
anyone give you a chance when it's a huge pain in the ass?

>Those who want to crucify me over spam need to evaluate this on a case by
>case basis. Judge me on my merits, not on a one-size fits all. Dont throw
>out the Baby with the Bath Water!

What would those merits be? You spam and have a poor selection of payment processing. Your prices seem high and you don't seem to have any merchandise that can't be gotten elsewhere cheaper and easier.

>You try being one of the last of the Atari Dealers still Advertising. It's
>not like they don't need the Business. They just don't want to put up with

I suggest you do some reading in the netiquette RFC. Sorry I don't have
the number right now but it is easy do find. There is nothing else except
that and national laws that regulates what should or should not be posted
here.

Btw, you might find some good advice yourself how a proper newspost is
written regarding citation tecnique.

>caused him to use ADV. He could have done that on his own for us. But Ben
>doesn't care about us. Ben wants our MONEY! And he'll walk on us to get
>it.

An ISP could put any restrictions they want to on its customers.

But the most important thing is: it's always stupid, non productive and
off topic to fill a newsgroup with nothing but complaints about posts
made by others! Imho wannabe moderators are simply repugnant.

Threads like this are destructive to a newsgroup and I have said enough
on this subject. Time to browse to Ben's site and select some stuff to
buy. The url is http://www.aracnet.com/~atari/catalogs.htm for those who
have missed his posts :-)

Hi All

I am looking for Rajah Lone's email address, unfortunately when I downloaded Cresus the documents didn't list his address. I want to report back some error reports!

Also does anyone know how to get in touch with Harald Becker the author of BoxKite as I want to register it!
The email I used was: nc-beckerha3@netcologne.de no response for over a week now!!

Thanks

Neil :-)

Play around happily but dont do too much. I'll have a modernized version ready within
a week (If nothing goes disastrously wrong ;-)

I've already done the following:

Version 2.00

- Right button is double click. No more pain in the shoulder.
- Use Ssystem(-1,...) for detecting MiNT.
- If mint, use Ssystem in find_cookie.
- Only 1 version for MiNT, MagiC and single TOS.
Global boolean mint and magx used throughout dynamically.
- Arrogant MiNT's Dreaddir spoils case of DOS 8.3 names.
Change DOS 8.3 names back to upper case.
- Resource to modern AES 4 3D flags and WHITEBAK object types.
Had to change dialogie titles to G_STRING's
- Fix rsrc_title() to be able to use G_STRING titles in stead of
G_USERDEF or G_BUTTON.
- Dialogue title userdefs written transparent.
- Many places:
fix unsetting of bits in ob_state, to preserve the WHITEBAK bits.
- appl_getinfo protocol that also works with MagiC;
(WHITEBAK detection) and shel_write behaviour).
- MagiC: shel_write must specify SHW_PARALLEL.
- In text mode fuller only fulls vertically.

- Courtesy XaAES: UNDO searches for cancel button.
- Courtesy XaAES: Use cramped_name for displaying filenames.
If a filename doesnt fit in a box, replace enough of it by ...
- Always display copy and delete dialogue.
If confirm is off, continue, else wait for dialogue action.
- Textmode window displays date in front of time.
- As a preparation for colour icon support, icons are now loaded
by using rsrc_load.
- Replaced ALL ICONBLK by CICONBLK (colour icons embrace mono icons
and are downwards compatable to mono icons)
- Colour icons now work.

- Icons will be identified by name, not by index.

The last bit, which is the hardest., I am now finishing.

Teradesk was a Pure C 1.0 program.

Insert
#define __MINT__

at the end of the Pure C 1.1 version of TOS.H

If after that there are more duplicate definitions, simply remove them.

Well it may be dead as far as any more versions greater than
version 9, but from what I understand the authors will still
support version 9 and below. I only have version 8 and I love it.
I plan to upgrade one last time.

Advertising is expected on commercial media, that's what makes it
commercial, and when it pop's up on a licensed subsidised channel then i
complain. SO it seems the same theory applies.

Okay Ben, that's fine, but if you dont take credit cards, then I cant buy off you. Simple as that. It's so much easier for me to pay via a credit card, then to try to get a money order that you can actually cash over there, that it's not worth the effort, not when I can use my CC at other dealers or ebay. Thanks for your answer. I wish you well. Hopefully your local US people will support you.

I wouldn't mind an occasional post myself, but his reams of shitte are
downright annoying.

> Fourth, even if it is against the rules, that doesn't make it "off-topic".

What sort of logic is this!. Its against the rules, how off topic is that?.

> It has everything to do with Atari machines (as that's what he primarily
> sells). Please tell me how this is off-topic.

> Finally, the point of my post was not to say, "Everyone must agree with

I didn't even acknowledge this spoof branch of the thread and completely
agree that if someone has something to say they should do it other than
anonymously as we are now.

> As for the ads, if you don't like them, ignor them. If you can't ignor
them,
> set your newsreader to filter them out. If you can't filter them out, deal
> with them.

Your missing the point entirely, i shouldn't have to filter them, the nature
of the base is such that they shouldn't be here for me to filter in the
first place.

>I don't see how they can hurt you in any way. They may actually
> be helpful to some of us here, and help support the Atari community as a

> going around bashing each other like this.

I never used to take any notice of an occasional posting, but he's taking the piss, its getting to the stage where i could quote the crap he posts. If it was shorter and less frequent you'd not here from me at all.

Not trusting this newsgroup display, I checked the group via Google. Ulli had posted twice about problems with credit card purchases due to a German court decision that affected all German credit card business. As a result, they slowed down the English version but it will soon be finished. They are also releasing a Native Mac version for OS 9 and OS X.

For those of us who have used Ebay, we know about PayPal. I sent him email about the possibility of using this service for electronic transfer of funds. I received email from him tonight, and he wanted to know more. So I sent him the web address.

If it will work as I hope, the buyer would open a free (for the time being at least :-/) PayPal account, transfer funds to that account via checking or credit card, then transfer the funds to R.O.M.'s account. That's my idea, we'll just have to wait and see if it works.

Ken

(Ben don't take credit cards.)
May be a preference, has reasons, but even I can
accept credit cards now. Paypal sets up a whole new
world of online buying and selling. I mean I could
accept credit cards if I signed up for it, which I haven't.
International credit card transactions may actually be
a problem, I don't know if Paypal will do those.
Just rambling some more.
But I can't see how Paypal (or others I don't know about)
would do anything but increase sales, increase convenience for both the
dealer and buyer, and be secure, pretty much.
I guess there are some problems with credit cards, like
someone cancelling payment with their credit card
company after receiving goods.

> I tried connecting a Falcon to a TT via the LAN port using an Apple

"LAN" on an Atari suggest it was an ethernet port. Itï¿½s simple an not
ready to use AppleTalk port without support and software like AppleTalk.

LANPort on Falcon and TT are not more as an RS422 serial port.
You should try an null modem, not an mac printer/modem cable.

Article 12.6.1 of DOITF030 contain the pinout of the port and
an null modem

Let him do his business. He has a right to post here just as you and I do. And we all have the right to click on whatever message we want to read. I see no wrong in what he's done or posted and it doesn't annoy me at all. In my opinion the more Atari dealers the better no matter what tactics apply.

Ben's an Atarian like us all and I can't see any justification behind badgering him because, well, there aren't many of us out there anymore and there sure as hell aren't many like him out there anymore. It just doesn't make sense to me that everybody ridicules him for having his interests, his hobby, his business which is Atari! For God's sake man! He's on our side!

3574. Booting from HD Falcon030 How?

Newsgroup: comp.sys.atari.st
Date: 2002-11-23 09:14:22 UTC
From: yvo.sNotThis@gmx.net
Message-ID: <1fm3j2r.1kvipi7163usw0N%yvo.sNotThis@gmx.net>
Source record: 30881

I have a Falcon030, but I haven't used it for a few years.

For some reason I can not find how to install the HD (Quantum 120MB) and boot from that drive.

Can someone help me out?

TIA

Yvo

3575. Interesting digital-camera-control software

Newsgroup: comp.sys.atari.st
Date: 2002-11-23 10:43:36 UTC
From: vdjole@EUnet.yu
Message-ID: <arnm4l$q1k$1@news.eunet.yu>
Source record: 30883

Hi;

By chance, browsing through some messages in an astronomy-related newsgroup :),
I came upon an interesting link: http://photopc.sourceforge.net

That is the home of the PHOTOPC, an open-source, compact, command-line-driven
utility for control (through RS-232 or USB) of a range of digital cameras
(Agfa, Epson, Olimpus, Sanyo, Nikkon...) which all use a certain Fujitsu
chipset and in fact utilize the same communication protocol (details of the
protocol are available at the site). PHOTOPC is completely coded in C, and can
be compiled for MacOS, MS-DOS, Windows, Unix... It looks quite possible that it
could be adapted for the Atari/TOS platform(s) and used to create picture-
import modules for favorite bitmap-editing and picture-viewer applications on
the Atari. It appears to be fairly simple and small- size of the MS-DOS
executable is only about 75KB.

A preliminary attempt to compile PHOTOPC (as MS-DOS version) in PureC V1.1
created, after some minor juggling with header files, surprisingly few errors,
mostly in the module for direct control of the serial port(s), because of the
different I/O concept on the PC.

I do not have a digital camera so there is not much point for me to try
to adapt PHOTOPC blindly, but maybe someone will be sufficiently interested...

Regards;

That is nice; I expected something like that, so I did not approach it very
systematically, just a couple of simple fixes in order to familiarize myself...

>I've already done the following:
>[...]
>- Textmode window displays date in front of time.
>[...]

:) That was the very first thing I attacked... but approached it slightly
differently: it proved to be a more-less trivial thing to add three
items under "View" menu: Show date, Show time, Show attributes, and to
add several lines of code into dir.c and window.c to turn on/off the display
of those fields. Another simple change I did was to add another field into
"Info" so that it displays both free ST-RAM and TT-RAM (well, I have to
admire a little the effects of adding a home-designed 8MB Alt-RAM board to
my MegaST4 ;))

If I may suggest several functions which perhaps You will be willing to
consider adding sometime, mostly to be activated under "File":

- Shutdown (maybe instead of Quit?);
- Format floppy... (no need for graphical progress display- numeric would be
fine, but would be nice to be able to specify non-standard number of
tracks and sectors);
- Delete;
- Search... (for file or, even better, for file and string!);
- Compare files (nothing sophisticated, just equal/not-equal, and maybe show
the first difference);
- Showing (and possibly changing) program-header flags for executable files
in "Show info";
- Two items under "View" menu title are, in fact, redundant: Show as icons
and Show unsorted; the same effects can be specified by (un)ticking other
appropriate items; this could be helpful for reducing menu height in
low-res displays;
- Setting keyboard shortcuts in Set preferences under "Options";

- Setting single/parallel and limit-memory program launching options in Install application under "Options";

I am aware of the fact that adding additional options usually results in the code becoming larger and larger, until the application at last becomes mostly useless ;) but I think that such simple (ok, not all are exactly simple) functions as above would not result in a large increase in size, more so because you will possibly optimize other things with the effect of reducing the executable size.

You read every message?! And every one of Ben's Bravo Sierra ads clearly states in the Subject line that it is selling something. And yet you read them? Do you read every line? You do know how to skip a message or block a sender don't you? Or are you and those who carry the same attitude have set themselves up as the news group police telling all what they can see and read.

Some of us, myself being one read the Atari news groups for one purpose, to see who is selling what.

Here's a puzzlement: Several criticize Ben's ads because even though he's on topic, posting abut Atari hardware and software, the complainers only criticize. Seems they violate the news group guidelines for being off topic.

Support to call an external shutdowan.app

> - Format floppy... (no need for graphical progress display- numeric would be
> fine, but would be nice to be able to specify non-standard number of
> tracks and sectors);

Could also call a format.app rather than being part of the main code.

> - Delete;

I've not seen TaraDesk yet. Is there no trash-can at all?
This should be practial and simple to add.

> - Search... (for file or, even better, for file and string!);
> - Compare files (nothing sophisticated, just equal/not-equal, and maybe show
> the first difference);

Again, just call an external app of the user's choice and pass it some
paramaters. There are several nice file search utilities about like suji.

> - Showing (and possibly changing) program-header flags for executable files
> in "Show info";

This would be useful...
Even if one stll needs the cpx to 'change' these flags...it would be great to
have a desk top that shows the status of the flags for each file.
I.E.
FILENAME.TXT 11/10/02 SIZE FLAGS

> - Setting keyboard shortcuts in Set preferences under "Options";

Use clocky?

> - Setting single/parallel and limit-memory program launching options in
> Install application under "Options";

The ability to memory limits on specific apps run from the desk top would
definately be a welcome addition!

> reducing the executable size.

It doesn't have to...
Many of the things you mention do not have to be part of the main code,. but can be launched as a side-application that goes away and frees the memory when done. Many of which already exist and are quite good. TeraDesk just needs to know about them (if it doesn't already?) and how to use them.

Brian

>> Fourth, even if it is against the rules, that doesn't make it "off-topic".
>
> What sort of logic is this!. Its against the rules, how off topic is that?.

Let me clarify what I meant:

1. I define on- and off-topic as whether or not a post is Atari-related.
2. Something can be on-topic subject-wise, yet still be against the rules if the rules say the method of posting (i.e. advertising) is wrong in this venue.

So under this definition, something can be on-topic, yet against the rules. I personally feel that his posts are not against the rules, as many people have posted here selling things without any uproar, and people have posted evidence that it is not against the rules to advertise something here. The only difference in this case is that he advertises more often than most, which is apparently the problem you seem to have with it, according to comments you've made.

In my opinion, since we are such a small (and apparently declining) group, we should be able to make some exceptions for people like Ben, trying to get by through supplying us with things we need, rather than being so hard nosed and rule-oriented about it when it doesn't suit our liking.

> I never used to take any notice of an occasional posting, but he's taking
> the piss, its getting to the stage where i could quote the crap he posts. If
> it was shorter and less frequent you'd not here from me at all.

If you can quote the posts, you must be reading them. Why? Just ignor them when you see who they're from. Turn on a filter and you'll never see them. But to some of us here, his posts are good, important, and on-topic. So why not just let it go, ignor it, filter it, whatever. Don't read them unless you intend on seeing what he's advertising. It's really very simple to do. And it's much better than making a huge fuss over nothing. I really don't understand what the issue is with it. With less energy than it takes to write even one of your posts complaining about it, you could have filtered it out a long time ago.

Just my opinion...

Thanks. This isn't for the ST though. I have heard here that some have had
problems with HD drives (?)
Maybe it is the cheaper disks that are causing problems - maybe it is the
way they are formatted. I have tried several HD drives though and it is just
unreliable.

3592. Lyndon/Redelberger EtherNEC revisited

Newsgroup: comp.sys.atari.st
Date: 2002-11-23 23:47:16 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3de013746e9820@tripnet.se>
Source record: 30902

I have made some further tests with The EtherNEC Ethernet package to make it run with my TT. I now runs 100% OK on my main TT with Magic 6.20 & Jinnee.

There must be some rather narrow time-windows inside the driver software as it is very sensitive to its environment.

To make it run on my main TT I had to skip the idea of using ENEC3.STX at all.

The other ENEC.STX that is intended for 68000 ST's on the other hand can be made working perfectly stable under Magic here if it is setup to load and run from TT RAM and is the last physical driver inside the STING folder.

With TOS 3.6 it's the other way round, ENEC3.STX works but ENEC.STX don't! If I try to disable the cache it will not work at all.

On another TT I got it running fairly well with Magic and ENEC3.STX but not at all using ENEC.STX, neither with TOS or Magic!

To me it seems there is some delicate timing that the driver can't handle properly when used on a TT. Maybe the driver could be programmed to find the correct timing on startup by sending dummy packets with different timing to find the center of this time-window?

Anyway I'm satisfied with transfer speeds as I can now use all the bandwith of my 512 kbit ADSL line. Locally I get c:a 1 Mbit out from this TT and 600 kbit when downloading using ftp_serv.app under STinG.

I've dropped MagicNet for now as the STinG setup is OK.

The docs mention there is risk for buffer overflow with a too big tcp recieve window. I lowered mine to 4380 first but have been using my "normal" 11680 now again quite a lot without side effects. Ideally you actually need an even bigger receive window at 512 kbit to get full transfer speeds over long distances but 11680 will do for now...

Hi Again Claudio,
Your reply was fine! I don't like log stories anyway :).
I tried Google but the text must be typed into the field which makes
it a bit tedious! It would be nice to be able to drag a file onto a
TTP program that gives a general translation (although I assume there
would be alternative results).
I'll look at the above URL also.
Thanks again,
John G.

<BIG SNIP>

Did you make further tests with my version of the NE2K driver for
EtherNEC? When you first tested it, did you use use 'ne0' instead of
'en0'?

Hi there.
I've decided to dig out my ancient 520 STFM. I've been looking at this group for a few days and have picked up a few tips but require further help. I would like a bit of assistance in bringing my ST up to date. These are the bits I would like to do.
1) Drive is a 360kb. I think I have this covered as I can buy a replacement for about ?15 from http://www.1632-sales.zenwebhosting.com and I have seen the article on converting a HD drive to DD (thanks Hallvard).
2) Upgrading memory. I have some old 30 pin 1meg PC simms. Are these likely to work or will I need to buy Atari specific items?
3) Upgrading the operating system. I currently have to boot up with a floppy in drive a. Is there a way to upgrade the OS as I think I have one of the 1st STFMs?
4) Connecting to a router to browse the 'net/email/news. What am I likely to need if possible?
5) Installing a Hard drive and CDrom. I have internal IDE drives that possibly could be adapted or will I need Atari items?
6) Blitter chips. My posh friends had these when we were kids but I could never afford one :-). Are these still the thing, am I likely to be able to get hold of one/anything I should know?

I realise this is a bit of a stream but I would be grateful for any help. These are all questions I probably knew the answers to 10 years ago but it's all gone fuzzy so please treat me as a thickie!

TIA

Paul

I first had it wrong and it did not work off course. I have never tried MagicNet before but was able to Ping localhost so I guess the rest of the setup was OK.

I then tried with the correct interface name but had to reinstall MagicNet. This time nothing worked. I may have got the setup wrong the second time but I had very little time to analyze. I will do some further tests, maybe today.

I normally need some routing capabilities on this TT as there are some subnets attached to the serial ports. I also must be able to "dial out" to my WinCE computer and I'm not certain MagicNet can handle that.

> I tried Google but the text must be typed into the field which makes
> it a bit tedious! It would be nice to be able to drag a file onto a
> TTP program that gives a general translation (although I assume there
> would be alternative results).
> I'll look at the above URL also.

You will not need to type it, as you may also cut&paste it, but please note, it will "translate" *) only texts of a certain length. You will need to do it again for the rest of the text.

*) it's not really translation, it is more giving word translations.

There is another engine by IBM that does a better job:
http://www.alphaworks.ibm.com/aw.nsf/html/mt

In both engines you can also type in the URL of a website to have it translated. (So you might upload the not translated text and have it translated online)

Good translations!

btw, to keep it OT: Are you translating an Italian manual for a ATARI program?

regards

Claudio

Hi

I think you've answered that one:)

>2) Upgrading memory. I have some old 30 pin 1meg PC simms. Are these likely
>to work or will I need to buy Atari specific items?

Upgrading STFM's are not a straight forward as STE's. You will usually
need to buy/find a memory upgrade. Marpet's extra RAM deluxe uses the
memory you mention, but most upgrades done and are fixed at either 1,
2/2.5 or 4 meg.

Most upgrades are plugin, that requires the MMU and Videoshifter to be
socketed. I would think it wise to check before buying an upgrade.

>3) Upgrading the operating system. I currently have to boot up with a floppy
>in drive a. Is there a way to upgrade the OS as I think I have one of the
>1st STFMs?

STFM machines done have an operating system on disk, the TOS (which is
the OS) are stored in chips on the motherboard. If you leave the
computer switched on for a couple of mins, without a disk in the drive
you will get the familiar green desktop.

Maybe the disk you are talking about is called the 'Language' disk,
which contains the 'control panel' and a couple of desktop accessories;
there is usually some other software, but this varies it could be FirST
basic, ST Basic, some demo's etc.

>4) Connecting to a router to browse the 'net/email/news. What am I likely to
>need if possible?

It's been a while since I've had my machines connected to the internet,
this maybe due to an ancient modem giving up the ghost.

But yes you can get on the internet using an Atari ST:))

Software I used were: Sting (tcp/ip stack), Newsie (email/news/ftp client), AtaIRC (mr lp's baby), CAB (web browsing) and there ae lots of utls etc.

>5) Installing a Hard drive and CDrom. I have internal IDE drives that
>possibly could be adapted or will I need Atari items?

The best method/type of hard drive are 'SCSI' ones for us:) For this you will need a DMA-to-SCCI adaptor such as Link, Link 2, top link.... there are several.

This will allow you to attach cd-rom drive, hard drives, optical disks, tape streamers etc...

There are adapters out there that will allow you to use IDE hard drives.

The best hard disk driver on the market is the excellent HD Driver. I use magneto optical disks to transfer between Atari's and pc, and hd driver allows me to format a disk that is readable on both machines, although the pc hates certain names of file!

>6) Blitter chips. My posh friends had these when we were kids but I could
>never afford one :-). Are these still the thing, am I likely to be able to
>get hold of one/anything I should know?

It would cost a fair bit to upgrade a single sided drived STFM:(For a guess you will be using either TOS 1.09 or TOS 1.02.

TOS 1.4 (aka Rainbow TOS) supports the blitter chip.

Personally if you are going to spend money upgrading drive & memory, i would consider buying an STE: These come with double sided drive, Blitter chips, DMA sound, hardware scrolling, more pretty colours to choose from, enhanced joystick ports (in a sensible place for once) which allows you to use Jaguar joypads on some games, TOS 1.06 or 1.62...

And they are a doddle to upgrade the memory, most use simm's:))

Steve answered pretty well the questions up to here (and after as well), but
I have some things to add.

> 4) Connecting to a router to browse the 'net/email/news. What am I likely
> to need if possible?

You can use a serial cable and a PC to provide internet access to your
atari, this is the more difficult and slow way. If you have a cable/dsl
router the by far easiest solution is to order an EtherNEC from
http://hardware.atari.org and give your STFM ethernet. If you want some
help on how to get it done through the PC, feel free to email me.

> 5) Installing a Hard drive and CDrom. I have internal IDE drives that
> possibly could be adapted or will I need Atari items?

Well, new Atari SCSI host adapters are rather pricey and used ones are hard
to find. However I am looking for a good home for my SupraDrive 40. This
plugs right into your STFM and even has a battery clock so your clock stays
set. The scsi drive inside is 40 megs, but if you like I can replace it
with something larger (like a gig or so) before I ship to you. I paid $56
for this drive a month ago, so I'll ship it out to you for $50.

> 6) Blitter chips. My posh friends had these when we were kids but I could

I've never really noticed any effective improvement with a blitter chip,
steve probably answered this question better.

Hmm... maybe. I think I've tried DD disks with the HD drives and had
problems again though.
I guess I'll need to find the time to go through all the permeatations.

Well these disks are formatted in 256 bytes a sector instead of the usual
double that. There are 80 or 81 tracks - I just wondered if this somehow
might have a difference.
But yes, DD formatting of a HD disk.
>I can't say I've had any problems with my Sony HD drives.

Perhaps it is just the disks then.

Steve M

3603. 2 Mb simms

Early ST's do have TOS on disk, althoug I'm not sure if that only applies
to STM's.

> The best method/type of hard drive are 'SCSI' ones for us:) For this you

Not so sure about this... ;-) I have one of Mario's IDE-adapters, and I
also built one for a Mega ST I used to have. IDE is simpler and cheaper,
and there's room for a 2.5" drive inside an ST. The adapter is harder to
install though.

> But yes, DD formatting of a HD disk.

The problem is that HD floppies are designed for the much weaker magnetic
field used in "HD-mode". Writing to HD floppies in DD-mode will very
likely destroy data on them.

> Should these work on an STe ?

IIRC, the STe (520 or 1040) can only cope with a maximum of 4 SIMMs
with a maximum size of 1MB each. I believe that they have to be installed
in pairs, and that they all have to be the same size.
I'd love to double check that I've got that right, but my mother
threw out my STe mere days before I retrieved it from her house- "I threw
away an old keyboard you didn't want", aaargh! I'm still extremely bitter
about that.

Oh, I see... Nice. Still, as far as I could see it is currently only
usable in Mint? (what does one do with a rpm package in TOS? - and even
unpacked, would this version work without Mint?)

Yes the early ST's had tos on disk, but as far as i know all STFM's are
rom based.

If Paul has a SS drive then the machine is very old, and it's possible
that the OS is on disk, with only start-up ROMs fitted. What dates
do you have in the Info dialog, Paul?

>It's been a while since I've had my machines connected to the internet,

Hi

I've never got my hands on any 2meg simms, so cant really say. But i do
know you can stick 4 x 4meg simms in an STE and they will work as 4 x 1
meg ones, so maybe 4 x 2 meg ones will do the same.

Probably not, due to the way the serial ports are handled. I don't think
it would be very difficult to adapt it to TOS/MagiC though.

Brian Roland a ï¿½crit:
>On my Falcon the C partition frequently reports a "Path Overflow" error.
>Hard disk scans report no errors.
>What does path overflow mean?
>How do I track it down and get rid of it?
Many possibilities :
1- put a little utility called FOLDRxxx.PRG in your AUTO folder,
and replace xxx with a value of, say, 300 to 500, depending to
the amount of memory you have. There are some other utilities
which work the same way ;
2- set the appropriate option in your hard-disk driver - HDDriver
has it, so does Hushi, probably ICD too, and maybe CBHD as well.
All this corrects a bug in TOS that limits the simultaneously opened
folders to 30 - IIRC.

Enjoy!

J.-Luc

Thanks for all the responses, you seem a really friendly bunch.
Jo I will get back to you about the drive once I know what I will be doing with the machine long term.

I haven't got it up and running again yet but I think you are correct about the roms. I have found what I thought was a start-up disk but it is a 'Language Disk' as you suggested.
I think I will go the STE route as I would like to get it on the 'net with a hard drive. I actually narrowley lost out on an Ebay auction on one tonight. I plan to get one of the Ethernet Rom port thingies mention.

Once again thanks very much to all who responded.

Paul

OK I have now done quite a few further tests...

Your (ozk@atari-RULES.org) driver does not seem to work at all with
MagicNet here. I get a total lookup and if I let MagicNet autostart from
the Magic START folder I'm very happy there is a TOS in ROM to resort to
to fix things. Without that I would have had to Format c: and reinstall
the OS from scratch like the big Win guys always do... :-)

I guess this is really not so bad news as your driver is really for
MintNet.

When testing the Redelberger ENEC.MIF MagicNet driver I now got it
working perfectly on this TT! Right now I'm even running STinG and
MagicNet at the same time. I have another TT with the parallel to
Ethernet adaptor connected to my main switch.

I can Ping out via MagicNet and the EtherNec adaptor on this TT
(192.168.0.130) via the switch (192.168.0.1) to the other TT running
STinG Ethernet (192.168.0.129) and routing further out via Modem2
(192.168.0.193) back to this TT's Modem2 (192.168.0.194) and STinG gets
the message. Really cool!

Also tried the Redelberger ENEC3.MIF that is optimized for 68030 and it
does not work at all!

Also played the opposite way with STinG using the EtherNec on this TT
which also works fine. Then I setup MagicNet to only use Modem2 and that
also worked. But an interesting thing happend:

I simply can't Ping the 192.168.0.192 subnet from this TT (192.168.0.194)
under STinG. I have put in a proper extra route with 192.168.129 as
gateway to this subnet but no luck. The ROUTE.TAB looks like this:

192.168.0.192 255.255.255.192 EtherNet 192.168.0.129
0.0.0.0 0.0.0.0 EtherNet 192.168.0.1

To me this is OK. I also have similar entries in my pc's and NAT-box and
they have no difficulties to reach my subnets.

Another thing that puzzels me:
Normally I have subnets in in two levels to reach other computers via
SLIP so this TT also has the ROUTE.TAB entries (without Ethernet):

192.168.0.200 255.255.255.248 Midi 0.0.0.0
192.168.0.208 255.255.255.248 Serial 1 0.0.0.0
192.168.0.216 255.255.255.248 Modem 1 0.0.0.0
192.168.0.224 255.255.255.248 Ser.2/LAN 0.0.0.0
0.0.0.0 0.0.0.0 Modem 2 0.0.0.0

In MagicNet I have put in the line:

route add 192.168.0.194 en0 gw 192.168.0.129

That takes the packets to the first 192.168.0.192 subnet. But as I
can't(?) put in a netmask here the other computers on the second level
subnets can't be reached. Off course I could add a line for each computer
but this is not the "right" way do do things.

Is there a way in the MagicNet MAGX_RC.NET to add a route similair to:

192.168.0.192 255.255.255.192 EtherNet 192.168.0.129

like it should be (but does not work?) in STinG.

I guess I really should phone Ronald Andersson about this too as there
must be something wrong in the STinG routing when Ethernet arp tables
come into play...

Hello,

A long while back I asked the newsgroup how to record Audio.
(I have not done the Audio Modifications on my Falcon.)
Someone suggested that I pick up a SPDIF interface (Soundpool) and
record directly into a Dat Recorder. Thus bypassing the Audio Mods.

I don't have a Dat Recorder. I only have a Tascam Stereo Casette
This doesn't have any optical or Coaxil. Only RCA.

Ideally, I would like to record from my mixer (1/4" jacks)
into the Falcon.
The outputs of the mixer to the input of the Tascam might be
too strong.
But if I could do this,
Would I be able to record using a Line Audio product
like FAD 2/2.?
(I looked all over, but was unable to find pictures of line audio
devices - Only the front panel of Jam Pro in/out)
It seems that all line audio products also require a SPDIF interface
in order to work with Logic Audio.
("Works with Cubase Audio, Notator Logic Audio (needs a spdif interface),
Zero X, The Audio Tracker, Quincy, Stodio Son, to name a few...)

Why is this?

Wouldn't I be better off to try a stand alone D/A or A/D Converter.
Mixer Outs (analog) to converter in (analog) - SPDIF out to
SPDIF soundpool device?

thanks

ken

OK just climbing on to my soap box from my lofty position as one of the largest Atari resellers.....

I been reading the emails " purporting to be from Ben, personally I don't know either gentlemen and to be bluntly honest my sympathies lies with Ben in this manner. Probably because I put a Kill file on his emails I don't read all of Ben's emails.... and this time Steve I don't totally agree with you- I think SPAM is email crap not newsgroup crap. Ben can conduct business on his terms, not using credit cards acceptance will limit him but thats his choice - it is your choice to buy from him and submit to his terms and conditions, as long as they don't contavene local or national standards. The regularity of news posting shows enthusiam to sell, something all we traders have..... did I mention my web pages? link below.... (grin)

The gentleman using the anon remailer obviously doesn't have faith in his convictions otherwise he would be more open to, shall we say, direct contact. But if you read the terms and conditions of the Frog remailer that is not too suprising, personally I have yet to find a really good reason to use a remailer except to hide your actions. BTW a quick transcript is below..

Unpleasant messages on NG
I do not speak more than 6 languages and I am not interested in all the 70.000 NG I have access to, not even their charters. Besides, I feel no vocation in censorship, and I do not read what emerges from the remailer. In addition, remailers are dedicated to allow expression from minorities, even extremist views. (Cf: F.A.Q. (Questions and Answers) <Pol_EN_Faq.html> about most serious matters.) If your case is strong, convince the trouble-maker. If not, ignore him: he will get bored. Do Not Feed the Troll. On the other hand, in case of persistant and obvious annoyance, one cannot emphasize too much the use of individual *filters*, available on all recent newsreaders. That feature will be quite efficient, because most trolls and trouble-makers *love* to sign their deeds, their are craving for any kind of notoriety, whatever dubious.. And broadcast the information *by private mail* to NewB tempted to react impulsively to the loud-mouthed. It is now possible to ask for such messages to be filtered, against their "From:" Write to Frog-Abuse <mailto:Frog-Abuse@nym.alias.net?Subject=Complaint: Please Block A Regular Obnoxious Nick>.
If you want to contact admin on the Frog remailer try http://www.privacyresources.org/frogadmin, but after reading above I don't think you will have much luck.

HI!

Due to popular request, I have created a page for NoSTalgia which is the Atari emulator for MAC with notes on how to get it to work by Harry Koopman(of MIDI-JOY), so if you have a Mac and would like to try Atari-MIDI programs on it, please check out NoStalgia.The download is included with everything you need to get it to work. Just print out Harry's notes. Since I do not have a MAC, I have to rely on Harry's experience.Have fun with NoStalgia, the Atari emulator for Mac.

Very nice !

To use an hard disk image with NoSTalgia 1.1 do the following:

- create an hard disk image with the built-in menu
- rename it to HDD-C or HDD-D
- check that you have TOS 1.4 or better
- Check that the hard disk image and 'cart.img' are in NoSTalgia's
forlder.
- Launch the emulator, and enable the hard disk.
- Install the hard disk onto the Atari Desktop (install dirive) and save
the deskop.

To transfert files to the hard disk:

- quit the emulator.
- drag and drop the HDD-C file on DiskCopy (Applications/Utilities).
- Transfert your file and unmount the hard disk image.

And, you can use Midi Apps with NoSTalgia on MacOSX

Hi Ken,

For years now I'm using a Line Audio JamIn A/D Converter to feed the
output of my mixer into the Falcon to process it with AudioMaster.
Not the slightest need for SPDIF.

Only thing I would need would be someone who swaps my Soundpool MO4
for an equivalent Line Audio D/A device since the plugs and cables
of the soundpool products don't match the ones of the Line Audio
equipment and when I use AudioTracker I have to feed music back
from the Falcon to the mixer at the same time as recording the
additional track.

>
>Although it's slow and limited without a hard drive.

Aha! This was the question i skipped over:)))

Without a hard drive internet activity will be restricted. I tried a
while ago, when i first got on the internet, and i used a 4 meg machine
with a 2 meg ram disk and 2 drives. I transferred all the files into ram
disk and then made sure i saved the data back again!!

I joined the internet on an Atari, I hardly used a pc at that time
except for pinball games. Newsie served me well and AtarIRC sorted me
out for ircnet.

And I'm thinking html is longwinded now on a pc, many of us used to do
html the hard way, still the best way to learn html i think:)

Good idea :-)

I was made the same (in french) 2 years ago ;-)

Do you know there is a 1.1 version ?
http://users.skynet.be/sky39147/NoSTalgia_1.1.sit
(only 0.65 on your Web site) :-)

Best regards,
Paul CAILLET.

Why not rope Durs Locher in? He's already got a fine GEM utility in the form of PhotoTip, and might be able to use this code to add support for those cameras.

Cheers

3634. Anyone have a Falcon for sale?

Newsgroup: comp.sys.atari.st
Date: 2002-11-25 12:28:53 UTC
From: sonik@whsmithnet.co.uk
Message-ID: <3de21785_1@news2.vip.uk.com>
Source record: 30943

Hi folks

Whilst having a discussion on hardware with a fellow Atarian the other day, he said he had been looking for a Falcon for a while. I was wondering if anyone here knew of someone or somewhere that has one for sale. I think he was willing to shell out a few bob to get one in decent working order.

Ironically he stopped using his STFM for music use and started to run Cubase VST on his PC instead but says it's a bit of a pig for music and he'd like to get back to the immediacy of an Atari.

Please feel free to post here or mail me direct and I can put you in touch if you have one to sell (UK preferred).

Cheers
Al

3635. Wensuite V3.3 Script

Newsgroup: comp.sys.atari.st
Date: 2002-11-25 12:29:03 UTC
From: Stephen Moss <sgm23@eng.cam.ac.uk>
Message-ID: <art4ve$a8s$1@pegasus.csx.cam.ac.uk>
Source record: 30942

Does anyone have a working Freeserve script for wensuit V3.3?.
I can log on ok with V2.0 as it has an option for setting the
authentication (account login and password) to use text format in the
PPP Link set up. Connecting with V3.3 using either the Auto or None
script options results in the connection being terminated presumably
be the provider upon non recipt of an authentic login/password.
Having read the instructions it would appear that the only method of
achieving text authentication under version 3.3 is to select the
manual script option and create your own script. I must admit that I
did not fully understand this information and so just copied the
script shown in the documentation, now as opposed to terminating the
connection it just sits there doing nothing which according the
documentation is probably due to an incorrect script.

Thanks,
Stephen Moss

>
>These should be handled by external programs that desktop only calls when
>they are needed, there is no need to bloat desktop.

Yes, that would be a quite valid alternative approach- having a "modular" desktop with most functions handled by separate little applications. Magixdesk (visually downright ugly and usable only in Magic) does it that way to some extent (copy, search, format, shutdown, install application...) and that concept can be followed even further (about, show info, set preferences... etc.): what surprises me is that none of the desktops uses a separate module for the configuration of the desktop itself- which is an operation that each user does only once or several times but can be quite complex and probably memory-consuming (which may the case with Jinnee?).

A modular approach would probably be very good for a machine with limited memory resources. On the other hand, I can think of several situations (e.g. a machine without a hard disk) where a modular concept would not be practical. I think I prefer an all-in-one approach (possibly just a matter of personal taste), maybe because of an idea of systematically adhering to concept of all user interaction to the operating system being done through one "Dekstop" application.

I would not like my remarks to be understood as critisizing of Henk Robbers who showed a praiseworthy wilingness to maintain and further develop that application, and who is certainly more competent than me to do whatever he sees fit in order to improve it.

Source record: 30805

Hallo Kenneth!

KM>The ROUTE.TAB looks like this:
KM>
KM>192.168.0.192 255.255.255.192 EtherNet
KM>192.168.0.129

Try 255.255.255.0 instead (or 192.255.255.0, if I'm right).

And there's no need to add a gateway in order to reach a directly connected machine!

I'd write 192.168.0.192<tab>255.255.255.0<tab>EtherNet<Tab>0.0.0.0

To be honest, I did never totaly understand this gateway stuff. Just trial and error (and some examples from the web, e.g. from Olivier Booklage) until it finaly worked ;-)

I've got some network up and running in Ahornberg, with ROM-Port-Genius-Adaptor and MagiCNet on a CT2A Falcon, some 5-port ethernet switch, my brothers W98 PC, and sometimes my Milan (which normaly is located here in Bubenreuth).

I've also been able to link my second Falcon to this network using a Midi type connection to the CT2A machine, but had trouble last time (ethernet card had vanished until I disabled the Midi link on the CT2A).

KM>In MagicNet I have put in the line:
KM>
KM>route add 192.168.0.194 en0 gw 192.168.0.129
KM>
KM>That takes the packets to the first 192.168.0.192 subnet. But as I
KM>can't(?) put in a netmask here

There's some line in the magic_rc.net sample file:

ifconfig sl0 netmask 192.168.1.0

mit freundlichem Gruï¿½ aus Bubenreuth

It's read failure. Sometimes when I format a disk, it won't then boot.
Sometimes it formats OK and I can write a file but then can't read the
file - or can only read it in one particular drive. It's all very odd.

I understand you very well. Actually it is very tantalizing to start frantically
adding loads of features to the program.

The point is that I want to spent such effort on a modular version for MiNT/XaAES
combination. XaDESK.

I'll maintain a Teradesk version having as little changes as possible.
Sort of a base version in the spirit of the original. For those who dont need more.

I would encourage people to copy the source tree and do whatever they like with it.
It is certainly not my intention to deprive anyone from such a pleasure.

Feel free!

There is nothing against having different flavours of GPL desktops written by different
authors or groups of authors.

Hi

My Golden Image Atari/Amiga mouse has started to malfunction. The housebrick original Atari mouse I have is a nightmare to use, so has anyone got a suitable good quality mouse for sale?

Happy to buy new, or second hand if mouse is in very good order.

I'm also interested in Magic 6 and NVDI 5.

The upgrade prices from Magic 5 and NVDI 4 are way too much for me to justify nowadays, so looking for s/h copies.

Look forward to hearing from you.

No. I have never had any problem using the Atari mouse as long as it's kept
clean and the wires are not broken.

Silkmouse helps if speed is the only complaint.

The problem probably isn't that it doesn't work well, but that a lot of
people don't like the feel of it, plus the speed issue you mention below. I
personally don't have a problem with the feel of it, but I've met people who
do.

> Silkmouse helps if speed is the only complaint.

One thing to watch out for when using Magic, like this person does:
Silkmouse makes things a bit unstable. At least it did on my system. I
couldn't figure out what was going on (as it was a very hit-and-miss problem
that I couldn't find by simply eliminating AUTO/ACC/CPX programs). Then
someone suggested not using Silkmouse, and all has been perfectly stable
ever since, although the mouse pointer is almost painfully slow now.

Nevermind the fact that you need 400 psi of pressure to push the buttons down, or that the mouse is bigger than my head. ;-)

I have to agree, using the original Atari mouse is IMO not very pleasant, even with a mouse speeder. Not as much due to the force needed to press the buttons, but rather to the fact is not very ergonomical and has a bad resolution.

I'd say a modern replacement mouse is worth every penny.

Regards,

Joakim

The mouse is not broken, it's just an utter pain to use. I've used an
Atari for 12 years intensively and know a good unbroken mouse from an
unbroken rubbish mouse!

>Silkmouse helps if speed is the only complaint.

Speed is just one of the problems, lugging a housebrick across the
desk is another! ;-)

The biggest shock after coming from my cheap but good Windows mouse to
the Atari one was how low the resolution was and how clunky the
switches were!

Yep, my complaints!

>I'd say a modern replacement mouse is worth every penny.

Yep, the Golden Image one was lovely, served me really well for years. I think it has taken a knock at some stage recently and something has happened. I cleaned the rollers and the ball but no joy. The cursor just moves to the top of the screen and stays there. Not a software problem as the Atari mouse plugged into the same port works, just ever so slowly!

Btw. internals of the Atari mouse went through several revisions, using
at least two types of switches and two or three types of optical sensors
using wheels with different number of openings (i.e. resolution).
In at least one variant the buttons were supported by plastic blades
which acted like hinges but were quite stiff. Drilling two 4mm-5mm dia. holes
through each of these blades (so that the cross-section and therefore
stiffness were reduced) helped to reduce the needed push-button force
significantly.

The biggest contribution to exceptional weight was a surprisingly heavy ball.
Perhaps using a lighter ball from another mouse migh help if the diameters
are compatible?

I tried to visualize the connections in your network- and I couldn't, but I got an impression that you did not set the routing quite right. Can you, perhaps, display (sort of) schematically which component is connected to which and through which port, what are the addresses, subnet masks and gateways defined for those ports, and what do you suppose is the domain of each subnet...

Well 6 people have stated in the Poll that they would participate.
But so far no one has sent me any email.

So we will make this a short one.

Rules for entries.

It runs in GEM in any resolution.
It has a holiday or seasonal theme.
It can be a game or toy.

Entries information should be emailed to me by the 24th of December
(Eastern Standard Time - United States of America).

I will put the information up on GEM Candy on December 25th.

Voting will start then and finish on January 6th.

Prizes:

There will be small graphics for websites for 1st, 2nd, 3rd, Participation
The thrill of competition.
The publicity for your self or your crew.
The encouragement to me to organize more of these things.

For more information email or go to
http://gemcandy.atari-users.net/

Please forward this/translate to other languages

3665. Re: Papyrus Dead?

> >dead as the Dodo. After all the promises.....
> >
> >Charles.
>
> Well it may be dead as far as any more versions greater than
> version 9, but from what I understand the authors will still
> support version 9 and below. I only have version 8 and I love it.
> I plan to upgrade one last time.

I've bought every version of Papyrus that's been made available, the wait
for this recent incarnation forced me to upgrade earlier...

to Word 2002...

Hi Ben

> I believe most who have decided not to buy from me have Pre-Judged me.
> Another word for Prejudice. Most of you have not given me a chance to
> serve you.

The fact that you choose to ignore criticism says to me that if a customer were to have a problem you would treat it in the same manner, by ignoring the complaint. Your attitude in here speaks volumes as to your attitude to customer relations.

> Those who want to crucify me over spam need to evaluate this on a case by
> case basis. Judge me on my merits, not on a one-size fits all. Don't throw
> out the Baby with the Bath Water!

A public acceptance that you yourself agree that its spam, that will thwart you defenders.

BTW, do you realise that some of us have to pay to download your crap.

I am not sure, it does some AV stuff (please look in vaproto.c)
What is a AV server actually supposed to do?
I hoped to learn from Teradesk.

Where can I find a description of the tasks of a AV server.

> And how does TeraDesk deal with long filenames?

That is one of the things 'as little as possible' ;-)

I think that anyone with anything to say should do it as we are, using real names and email address that can be replied to.

> Probably because I put a Kill file on his emails I don't
> read all of Ben's emails....

So you've obviously been offended by this shitte at some time.

> and this time Steve I don't totally agree with you- I think SPAM is email
crap not newsgroup crap.

That's really besides the point, its against the local rules, besides, its his whole attitude to potential customers that pisses me off, I've requested a number of time that he curb his mailouts and I've never yet had a response, you all seem to forget that at one stage we'd have to wade through about 30 Atari message bases to kill his crap, do you call that reasonable behaviour, if you conducted business that way then I'd soon be down to Rochester to piss through your letterbox, never to open my wallet and peruse your endless Atari packed shelves again.

>Ben can conduct business on his terms,

No he cannot, there are rules, put in to prevent this sort of abusive practise.

> The regularity of news posting shows enthusiam to sell, something all we
> traders have......

It show nothing but a blatant disregard for everyone that isn't pro Ben

The docs for Thing Desktop has a nice section an AV protocol.

Nevermind the fact that it's very easy to trace the point of origin of any person going through an "anonymous" remailer by having the right contacts and knowledge. The internet is a huge paper trail that reflects your decisions, good and poor.

3675. Looking for Zero Mag Back-issues

Newsgroup: comp.sys.atari.st
Date: 2002-11-27 07:58:53 UTC
From: google@asktoby.com
Message-ID: <25a29397.0211262358.610d6207@posting.google.com>
Source record: 30824

Hello all

I'm trying to find any old copies of "Zero Magazine", a multiformat computer magazine from the early nineties.

Somewhere along the line all my Zero magazines were thrown away. I would *really* enjoy reading those issues so much - If anyone has copies of this mag they could sell, or knows where I can get hold of some back-issues of this classic mag, I'd be really very grateful.

Hope you can help

Toby

>manual script option and create your own script.

I suggest that you use a terminal program such as Connect to connect to your ISP, and then interact with the prompts until you have a connection.

WenSuite uses a wait for/respond sequence in its script editor, so that should be easy to sort out, not sure if it needs a CR at the end of each response.

You might need to enter a string like "PPP" or "PPP default" at some point, possibly.

Or have I missed the point?

Cheers

Derryck

And there are a least 5 different atari ST mouse things, some need a
mallet for the buttons to work..... some dont realise they have a ball
inside or the bearing weren't fitted:P

One time, on my old ST, the old brick mouse had its button hardware break.
The switch itself worked, just not the switch-pressing plastic piece. I
performed a little surgery on it (figured I was just going to throw it away
anyway, might as well play) and inserted a small plastic "stick" between the
actual button and the switch. It reduced the distance the button had to move
in order to press the switch. The button was much more responsive, lighter,
less clunky, whatever you want to call it. There were some times when it was
almost too responsive and I would accidentally press it by placing my finger
lightly on the button. I shortened the stick by a miniscule amount and it
was just about perfect. I haven't done that with the mouse on my Falcon, as
I don't really mind it all that much, and I don't know if the idea was just
a fluke and if it wouldn't damage the mouse to do it again. Just thought it
was an interesting thing to have happen.

3684. Teradesk V2.00

Newsgroup: comp.sys.atari.st
Date: 2002-11-27 16:07:57 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <3DE4ECC9.801AB6E6@chello.nl>
Source record: 30834

LS

Find Teradesk V2.00 on my homepage (in sig)

Here is what I have done to Teradesk this far:

- Right button is double click. No more pain in the shoulder.
- Use Ssystem(-1,...) for detecting MiNT.
- If mint, use Ssystem in find_cookie.
- Only 1 version for MiNT, MagiC and single TOS.
Global boolean mint and magx used throughout dynamically.
- Arrogant MiNT's Dreaddir spoils case of DOS 8.3 names.
Change DOS 8.3 names back to upper case.
- Resource to modern AES 4 3D flags and MagiC object types.
Had to change dialogie titles to G_STRING's
- Fix rsrc_title() to be able to use G_STRING titles in stead of
G_USERDEF or G_BUTTON.
- Dialogue title userdefs written transparent.
- Many places:
fix unsetting of bits in ob_state, to preserve the MagiC object bits.
- appl_getinfo protocol that also works with MagiC;
(MagiC object types detection) and shel_write behaviour).
- MagiC: shel_write must specify SHW_PARALLEL.
- In text mode fuller only fulls vertically.
- Courtesy XaAES: UNDO searches for cancel button.
- Courtesy XaAES: Use cramped_name for displaying filenames.
If a filename doesnt fit in a box, replace enough of it by ...
- Always display copy and delete dialogue.
If confirm is off, continue, else wait for dialogue action.
- Textmode window displays date in front of time.
- As a preparation for colour icon support, icons are now loaded
by using rsrc_load.
- Replaced ALL ICONBLK by CICONBLK (colour icons embrace mono icons
and are downwards compatable to mono icons)
- Delete via menu (+CTRL)

- Icons are identified by name, not index.
This makes the 2.00 CFG incompatible to previous versions. !!!!

Make sure your icon files contain at least the following names:
FLOPPY, HARD DISC, APP, FILE, FOLDER, TRASH, PRINTER

To do:

^DEL on multiple selections.
use NKCC

use menu_keys() (Find shortcut in menu tree, not in a table)
drag&drop to other apps windows.
Full AV server functions.

Please consider it Beta!
If something is wrong, let me know.

Of course it isnt. HTML is ridiculously complex, redundant, spurious and ugly.
Considering the fact that I only need the hyperlink function.

If you stay away from all the 'features' added recently (and write it
by hand using an editor with a reasonable HTML formatting mode) and,
most importantly, do _not_ force the output to some specific window
width (!), I don't think it's too bad.
I have not seen anything I'd rather use for the purpose, but that
does not mean there isn't something out there, of course.

Anyway, there are really only two _very_ minor problems with your
page according to the validator. I'd almost call them deficiencies
in the standard (assuming the validator is correct).

First, the string in the tag is apparently case sensitive.
At least the validator does not stop complaining until all the letters
are exactly the same as in the examples. That's just insane, IMHO.
Second, you are apparently not allowed to have a + in front of a number
in a tag.

Hi

There is already a quick fix.
I forgot to make the wildcard and file type checking case insensitive.

I uploaded a new exectable on my homepage.

>gateways defined for those ports, and what do you suppose is the domain of
>each subnet...

OK here it comes. Those who read news with a proportional font should
stop reading here or you will only get upset for doing so...

My original setup without the EtherNEC adaptor works perfect. All
computers have full access to each other and Internet connection. The
routing tables are at the bottom of the text.

When I change from nullmodem to EthernNEC on TT3 I can no longer Ping any
of the computers on the nullmodem subnets attached to TT1 from TT3. TT1
and the two pc's are however reachable.

Note that when dealing with subnets _all_ computers (NAT-box included!)
must have an entry in there routing tables with the default gateway to
the subnets (192.168.0.129 in my case).

It seems there is something missing in how STinG handles Ethernet
networks. As far as I understand the alternative routing table of TT3 is
correct and equal to the "route add" command on the pc's?

When I tried with MagicNet instead I could Ping from TT3 to the subnets.
But what is the correct command to add the route with netmask etc in
MagicNet?

I really don't want to add individual routes to all computers on the
subnets.

And now to the actual diagram (with slightly different ip addresses
compared to my previous post). I hope it's correct:

```
Internet

I've placed 3 orders with Ben so far, all were quite satisfactory
and he saved me alot on shipping. He also called me with his own
nickle. I do killfile the ads, it's not so hard.
I don't understand why others simply can't manually skip the ads
or killfile them. I know where Ben is, if I need something I go
to his site and order it. The whole thing really is a non-issue.

3700. [UPD] December Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2002-11-28 09:13:30 UTC
From: Francois LE COAT <lecoat@lutece.net>
Message-ID: <3DE5DE3A.5040207@lutece.net>
Source record: 30759

Hi,

My software "Eureka" is updated and released on its WEB site.
It is a "2D Graph Describer" and a "3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka212.zip
That is the Complete Common Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny043.zip
Is the OpenGL Extension (requires previous package)

This month, the release number is the same as the version
number (2.12 that is always the same). I expect that everybody
will have understood ...

I wish you big fun with all this STuff !

Regards,

I use PhotoTip which should run under TOS as long as HSmodem is
loaded in.

Unfortunately it's not that simple. An essential element in the AV
protocol is the AV buffer, i.e. applications are passing pointers to each
other. Any MP-problems are easily avoided by allocating these buffers in
global memory, but if one application doesn't care about MP and then send
your nice and clean desktop a pointer to private memory, your desktop will
be terminated as soon as it tries to access it...

Yeah, it is not only the 16 byte msg buffer.

These unthoughtfull designed protocols are a real nuisance.

The drag&drop protocol demands the use of a pipe.
The correct way.

>Why not rope Durs Locher in? He's already got a fine GEM utility in the form
>of PhotoTip, and might be able to use this code to add support for those
>cameras.

I did not compare the lists of cameras supported in PhotoTip and PhotoPC,
and it may happen that they are the same- i.e. maybe PhotoTip was designed
around the same communication protocol as PhotoPC?

But I was trying to make another point: PhotoPC is a small, simple,
bare-bones, command-line application. My idea was that PhotoPC, not having
any bells and whistles in the form of a GUI, could be used as the core of
simple picture-import modules for graphical applications and viewers which
use external modules, such as Vision, Papillon, Megapaint, GemView, Graftool,
Look'n'See...etc. so that one would not be limited to just one (commercial)
application (PhotoTip) for interfacing to digital cameras.

Btw. if PhotoPC has already been ported to Atari- Mint at least, maybe
there should have been a feedback to the author(s) of PhotoPC so that
Atari be "officially" included in the list of supported platforms and
the Atari-related conditional-compilation segments in the code be propagated
into future versions? When I looked at PhotoPC page, I saw listed DOS,
Windows, BSD Unix, MacOS..., but not a slightest mention of TOS.

Bbtw. a similar thing happened with Infozip-group's Zip/Unzip utilities.
AFAIK the maintainers haven't the faintest idea that a moderately recent port
of Zip/Unzip is still existant on the Atari platform, and in fact complained
in the documentation that Zip has been abandoned on the Atari.

Great!!

I noticed that the binary is even smaller than the first GPL version, and also that there is a -very- noticeable increase in speed (several times faster!) when opening windows on folders with many files and subfolders (for some reason this seemed to be a weak spot of all alternative desktops so far).

I had slight problems, however, compiling the source with PureC 1.1: compiler reported missing include osmacros.s in mintbind.s (so I skipped compiling and used the provided object module instead), undefined Gem_pb in wind_get.s (fixed (?) by adding a globl Gem_pb delcaration) and the linker reported undefined symbol appl_getinfo (so I included into project applgeti.c, aesparbl.c and aes.s from version 1.42); also, it helped when I included prelude.h into a couple of files... right or wrong, the home-compiled program seems to work now.

Best regards;

I like this idea very much. Sort of like a Twain driver for that other OS -
import a picture from your camera straight into a picture window for editing
etc.

ScanX provides something similar for scanners.

That would be Philipp Donze's port?

Cheers

Derryck

Look Ben, just ignore it now.... he can postall the crap he wants and most intelligent people will just kill file it...eventually he wil go away. If he tries something nasty like a DOS attack or Email blockage you can report it to your ISP who willl take necessary action, or ISP of the remailer organisation who if they want to stay in business will certainly take action

I am curious what old version you are talking.
The PD 1.40 version of 1995 ia smaller and already very fast.

The reason for the speed is simple. Teradesk alligns the contents of the windows on
a modulo 8 pixel. This helps immensely on older single TOS, but even on modern
VDI's its almost sure it is faster.
Remember that ROM desktops aligned the outside of a window on a byte boundery, which
made certain that the contents were always misaligned and always as slow as possible. :-)

Yes forgot that one.

> (so I skipped
> compiling and used the provided object module instead),

That should work as well. (I used the same as for XaAES for a cross check)

> undefined Gem_pb
> in wind_get.s (fixed (?) by adding a globl Gem_pb delcaration) and the

> when I included prelude.h into a couple of files... right or wrong,
> the home-compiled program seems to work now.
>

the wind_get.s belongs to the native Pure C PCGEMLIB.LIB which also already
had appl_getinfo. My versions dates from 1993. I'll mention that in the readme.
The wind_get.s is needed for extended gets like 'XA', 'WX' etc for WINX and XaAES.
And SHADED for N.Aes.

If you keep using PCGEMLIB.LIB the library\multitis.prj is not needed.

Of course, if you use different lib's, such additions might not be valid.

Hi Roy

Assuming you are using the RF outlet...

Depending on the region its use was intended for, you may have the wrong modulator type. You may have one with 5.5Mhz sound and you need a 6Mhz modulator or vice-versa. Try and get a composite video lead for it.

> I just received an Atari 2600 unit. It gets video but no sound. any

Donald,

Unplug the monitor and replug it back into the TT. If the graphic drivers won't load, the video display will go to the original TT video port. Unless of course you blew your TT video up like my roomate did ;-) But anyway. I believe there's 4 programs. You need to run in this order
emulator.prg
menu.prg
something_bib.prg
sta_vdi.prg

and then whala. I know this because while farting around with my own mach 64 nova the other day I broke it bad and had to refigure this all out since it was setup years ago.

I found a program called AVSERVER.APP which was meant to add AV-Server functionality to MagXdesk. I tried it with Teradesk/XaAES. It - no surprise - did not work. Memory violations with MP-enabled MiNT, AVSERVER overflow messages with MP-disabled. But maybe the programmer, who has stopped programming for Atari, is willing to release the sources, so that it can be used with Teradesk/XaAES ? And has anyone tried it with MagiC ?

Anyway, this is the place where I found it:

http://www.barton.de/atari/download.html

There is also a program called AV-TEST.PRG there to test which AV functions are supported by your system.

Martin Tarenskeen

3733. Scanning 35mm negatives

Newsgroup: comp.sys.atari.st
Date: 2002-12-01 14:33:46 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3dea1dca.0@entanet>
Source record: 30792

I was looking at this device for scanning 35mm slides and negatives:

http://hh385.hiphip.com/merchant/SlideScan.htm

The problem with scanning colour negatives is that they cannot
be changed to their correct colour by using a simple negative
function due to the orange tint in the negative film.

Does anyone know of a method for converting them into
their correct colour ?

Regards,

Peter

I scan the n>gatives with the orange tint, then take a graphic programm like Chagall, then lower the red and green tints tint. Sometimes you can just add blue.

3740. Sharity Light on MiNT problems

Newsgroup: comp.sys.atari.st
Date: 2002-12-01 20:43:19 UTC
From: hencox@hotmail.com
Message-ID: <9ae36432.0212011243.72545153@posting.google.com>
Source record: 30700

Hello!

I'm trying to use Sharity Light (versio 1.1) under Mint (FreeMiNT
1.15.12) to access the harddisk of my pc, running win2000 pro. I have
the Server service running on the pc, and I've enabled sharing for a
folder on one of its drives. Under MiNT I type this to connect to the
pc:

shlight //pc/folder /nfs/folder

This seems not to work as it outputs to the screen:

Kernel: smb_receive_raw: Invalid packet 0x83
Kernel: smb_receive: receive error: -90
Kernel: smb_proc_connect: Failed to send SESSION REQUEST.
error connecting to server: [90] I/O error

I've searched through the internet for an answer to this, and I found
something that said that the stack has to be at least 128kB for
'shlight'. I ran

stack shlight

which stated that the stack of shlight was already 128kB.

What else is there that I might have missed?

Thanks in advance
Henrik Gildï¿½

I'm pretty sure I'm right on that score, there was a public key issued IIRC,
maybe someone else could expand on this?.

3742. Any dialup Atari BBSes left in the US?

Newsgroup: comp.sys.atari.st
Date: 2002-12-01 23:30:57 UTC
From: "Shane E. Curd" <nethak@mac.com>
Message-ID: <BA1005E1.2826%nethak@mac.com>
Source record: 30701

I see several European Atari BBSes still being operated, but I'm really interested in some dial-up BBSes here in the US with Atari software and users. Long distance calls aren't an issue as long as they're here in the states.

Thanks,
Shane

No, sorry, because there has been no way to get money from outside of
Germany (poor world ;-)), we had to care for the German business.

That's the crux if you have to live from what you program. Would be
lucky having a huge company and being able to say "Hey, Karl, finish the
translation within a week!".
But we don't have the money to have that Karl ;-).

But now we found an agreement with Nick from 16/32, that he can do the
things for us, and I'll hurry up to do the little finishing of the
version.

Hope to get ready with that before Xmas. So you can call me Karl (NO!
It's a JOKE! ;-)).

I missed the begining of this thread, the news server I am using keeps
messages for a very few days only unfortunately.

Boxkite is _not_ freeware atm. It's still in our catalog (Europe
Shareware) and the fee is 16.50 euros.

Best regards,
P. Ricard

Cross-posted to: alt.games.video.classic,alt.atari-jaguar.discussion,alt.games.lynx,comp.sys.atari.st

It's almost done! I've been working my tail off all November to get The Atari Times 2002 Year-End Issue ready! The pre-order deadline is just a few days away, so if you were planning on getting a copy (for yourself or an Atari fan for Christmas, perhaps?) you'd better do it fast!

The pre-order pricing of the 2002 Year-End Issue is $12.00 plus $4 for U.S. shipping (overseas shipping is $8.) After December 4th, the price will be $15.00 plus $4 U.S. shipping (overseas shipping, $8.)

More information about this 100-page book of Atari features, reviews, interviews can be found at http://www.ataritimes.com/yearend

Thanks for your continued support of TAT!

>[...]
>It depends a lot of the file system.

I did not refer to the speed of graphic operation, but rather to the
speed of disk/file operations. Here is an example:

On my hard disk there is a folder TERADSK2 with a subfolder SRC into which is
unpacked the complete source tree and where I experiment with compiling it.
Currently, SRC contains 6 subfolders and 188 files. I use TOS 2.06. When I
open a window on TERADSK2 and double-click on SRC, there is some disk
activity, and TOS desktop opens the window into SRC after about 1-2 seconds
(not easy to measure accurately). Thing 1.27 used over TOS 2.06 needs slightly
longer (a bit more than 2 seconds) to do the same. Jinnee 2.01 demo takes
about 4-5 seconds to do the same, which becomes unpleasantly slow. With
Teradesk 1.40a or 1.42 the same operation takes about 7-8 seconds which
can be quite annoying! With the new Teradesk 2 the operation takes only
about 1-2 seconds (hard to measure, but seems to be faster than Thing,
and about same as TOS desktop).

>The wind_get.s is needed for extended gets like 'XA', 'WX' etc for WINX and XaAES.
>And SHADED for N.Aes.
>If you keep using PCGEMLIB.LIB the library\multitis.prj is not needed.

Hmm, my version of PCGEMLIB (december 1992) indeed contains wind_get but
does not contain appl_getinfo (there are other appl_ functions, but not
getinfo). I suppose then that I can use applgeti.c etc. as I did.

You guys really should try Octopus if you haven't by now. It supports telnet or bbs over any port. Supports all ataris and clones, gem windowing, virtual console or tos mode support. It's spectacular in my opinion ;-) That and if you want any features added, I have the source code and can get cracking away. Plus it's freeware too.

I'm not so sure that would be a good idea, as there are several good
BBS programs (e.g. Octopus) already available. With the Internet,
there just isn't much demand for a BBS, although we could certainly
start one if there were interest.

I think I noticed some irregularities in your setup- but as I am not an
expert, just an amateur who, by necessity, had to learn how to configure
some networks at work, take my remarks with some reserve...

>My original setup without the EtherNEC adaptor works perfect. All
>computers have full access to each other and Internet connection. The
>routing tables are at the bottom of the text.

In fact, I am a bit surprised that it worked ok. I guess that some
implementations are flexible in interpreting the guidelines...

>TT3, MSTe, Stacy, Mega4:
>0.0.0.0 0.0.0.0 [Interface] 0.0.0.0

Comments in the Sting's ROUTE.TAB file say that:

The network specified can be directly attached to the specified port, in
that case no gateway is needed, as the datagram can be routed directly.
For a route to a network that is directly attached therefore the gateway
entry should be set to 0.0.0.0.
#
For an attached Ethernet the gateway entry specifies the gateway out of
the Ethernet, for a serial line it is simply the host at the other end.

so I would assign the gateway fields to be 192.168.0.XXX, XXX being the IP
addresses appropriate ports on TT2.

>TT2:
>0.0.0.0 0.0.0.0 Modem 2 0.0.0.0

And the same here for TT2, i.e. would assign the gateway to be the IP address of the corresponding Modem 2 port on TT1.

>Command on PC1, PC2 and NAT-box:
>route add 192.168.0.192 MASK 255.255.255.192 192.168.0.129

Hopefully you did not forget to specify "permanent" switch (something like "route -p add") so that the routing was not lost after next reboot.

>TT1:
>192.168.0.240 255.255.255.248 Ser.2/LAN 0.0.0.0
>192.168.0.192 255.255.255.192 Modem 2 0.0.0.0

As far as I know, subnet specifications 192.168.0.240/29 and 192.168.0.192/26 are conflicting. E.g. you are supposed to be permitted to have up to 62 nodes on the ...192 subnet (...192|1 to 192|62); the highest possible host address would then be 192.168.0.254, but this could be then interpreted as being in the ...240 network (...240|14). Defining subnets with different subnet mask lengths on the same host could be tricky, there is a RFC proposing a scheme for this (RFC1219). On the other hand, if you can't have 62 hosts on a /26-length subnet, then you don't have a /26 but longer subnet mask.

RFC1219 proposes the following scheme for assigning subnet masks of different lengths so that such conflicts be avoided (shown in binary and decimal notation):

/25 0 0 (reserved to mean "this subnet")
/26 10 128
/26 01 64
/27 110 192
/27 001 32
/27 101 160
:
:
/nn 011...11
/nn 111...11 (reserved to mean "all subnets")

There may also be a problem in that apparently some protocols (e.g. RIP- route information protocol) and some TCP/IP implementations do not (or did not?) permit having different-length subnet masks on a host. Another problem may lie in the fact that, generally, "all zeros" in a subnet mask is supposed to mean "attached network" and "all ones" is supposed to mean "all (sub)networks", so a declaration of a subnet ...192/26 (i.e. "all ones" in the last octet) might be confusing. I think that this "all-zeros" and "all-ones" stuff is obsolete, but some implementations may not be aware of that obsolescence. So perhaps it would be safer to define subnets so that "all-zeros" and "all-ones" do not appear anywhere.

Assuming that it -IS PERMITTED- to have all-zeros and all-ones subnets, I would propose slight modifications (marked by asterisks *) to your addressing and routing scheme, so that subnet masks on TT2 have the same length:

PC1, PC2 and NAT-box:
192.168.0.192 MASK 255.255.255.192 192.168.0.4 *

TT1:
Ethernet: 192.168.0.4 *
Serial 2: 192.168.0.65 *
Modem 2: 192.168.0.193
192.168.0.0 255.255.255.192 Ethernet 0.0.0.0 *
192.168.0.64 255.255.255.192 Ser.2/LAN 0.0.0.0 *
192.168.0.192 255.255.255.192 Modem 2 0.0.0.0
0.0.0.0 0.0.0.0 EtherNet 192.168.0.1 *

TT2:
192.168.0.200 255.255.255.248 Midi 0.0.0.0
192.168.0.208 255.255.255.248 Serial 1 0.0.0.0
192.168.0.216 255.255.255.248 Modem 1 0.0.0.0
192.168.0.224 255.255.255.248 Ser.2/LAN 0.0.0.0
0.0.0.0 0.0.0.0 Modem 2 192.168.0.193 *

MSTe, Stacy, Mega4:
0.0.0.0 0.0.0.0 [Interface] 192.168.0.XXX *

TT3:
0.0.0.0 0.0.0.0 Serial 2 192.168.0.65 *

TT3 Alternative with EtherNEC:
192.168.0.192 255.255.255.192 EtherNet 192.168.0.4 *
0.0.0.0 0.0.0.0 EtherNet 192.168.0.1

Adding a 192.168.0.0/26 route to TT2 should enable appropriate routing
without going through the NAT-box, but I suppose that things should
work even without it.

As an alternative, I would try to re-assign all addresses trying to avoid
specifying of "all-ones" and "all-zeros" subnets, just in case...
Note also that, as far as I remember, 192.168.XXX.XXX domain is reserved
for class-B private nets (cca 64500 hosts maximum), so you can easily use
the third octet as well, and avoid all CIDR subnet masking.

I dont know what to think of it.
I ran all 3 versions and all are just as fast on my TT Tos 3.06.

Well, it is so old (1992), it might well be possible that I once linked a new
pcgemlib adding my own appl_getinfo. A extremely simple operation for Pure C.
I just cant remember.

If it works for you, keep it that way.
I'll make sure that I wont break the multitos.prj.

3757. Silkmouse versions

Newsgroup: comp.sys.atari.st
Date: 2002-12-03 01:14:03 UTC
From: Jim DeClercq <jimd@panix3.panix.com>
Message-ID: <ash0gr$885$1@reader1.panix.com>
Source record: 30717

Someone posted that Silkmous was unstable on his machine. One version has a bad case of mouse creep on my TT, but there are two versions, and the older one works perfectly.

The older one divides mouse speed up into three speed ranges, and uses a different gain multiplier for each, and is adjustable for that.

The newer one uses one nonlinear curve, and that is the one that misbehaves, for no known reason.

Downgrade!

Jim

Yes, I've been using this with MagxDesk for quite some while. It's not
a full implemntation but works sufficiently well. Profile by Mark
Baines will tell you what parts are missing after it's been installed
through C:\GEMSYS\MAGIC\START\

No, it doesn't show up on the boot up screen. The STE or Stacy can't
detect/see it.

Hope that's a bit clearer.

RB.

Hello Lance,

&#65533; i have no idea if any are left. my question to you is would anyone here
&#65533;be interested in a new atari st bbs program?
&#65533; it could be a stand alone, or a telenet. i am looking for feedback.

Yes, I'm interested in a Atari BBS programm.
I would be happy to be your b&#65533;ta tester if you need.

I know one left : Inli BBS +49 236 355 661

Other BBS : Pictures BBS Gohlam +33 130 100 163

Hello Mark,

�You guys really should try Octopus if you haven't by now. It supports
�telnet or bbs over any port. Supports all ataris and clones, gem
�windowing, virtual console or tos mode support. It's spectacular in my
�opinion ;-) That and if you want any features added, I have the source
�code and can get cracking away. Plus it's freeware too.

I think the best computer for BBS is the TT because of his 4 s�rila ports
+ LAN, but I would like to try it on my Had�s : where to get it ?

Regards

What I think was meant is, do you see the ICD banner and drive details as
the machine attempts to boot?

Have you tried running the boot prog from floppy?

All the common boot progs, AHDI, HDdriver and ICD etc, put some sort of
banner/info on the screen.

Is the red LED on the Link II lit?

You also ask about your monitor, did this problem show up at the same time?

Send the Link in and I'll test it.

While speaking of Profile, it can be downloaded from my page, along with a regcode generator. I contacted Mark in the hopes that he'd feel like releasing the sources for the program for The Orphaned Projects Page, but for various reasons he wasn't interested in this.

However, Mark was kind enough to allow me to distribute the regcode generator, so anyone can now use this program without registering. Profile can be considered freeware now.

Hi gang.

I have not heard from ICD for a while on my order of ICD pro utilities 6.5.5.

Anyone have them?

Donald

3767. Ho w do I make my SCSI drives "ALWAYS" appear.

Newsgroup: comp.sys.atari.st
Date: 2002-12-03 14:06:33 UTC
From: Rob <rob.jenkins2@btopenworld.com>
Message-ID: <fvdpuus1gd1h4j1eoc0et9vlb60buq1190@4ax.com>
Source record: 30727

A while ago, I got a falcon with a 6gig IDE drive, partitioned into about 8 drives.When I boot up the computer, all the hard drives show up. I connected my External Zip drive to the computer, but everytime I start the computer, I have to goto the menu and click Install Devices to make it apper. I have just also added a 1 external scsi to it also, and again, I have to click the Install Devices option to actually see the drives. When the computer is restarted, they disappear, and I have to click the install devices option everytime the computer is switched on to get the icons on the desktop to access the drives.

(I have HDDriver 8 if this helps with the answer)
How do I make these icons always appear.

Thanks.. Rob

I didn't get the manual with it but would like one if anyone knows where (or a net version if one exists)

After installing the drives go to the desktop and press "S" to save the
desktop. That should keep the drives on the desktop after you boot.

Then find a falcon manual! :)

Well, yes, but:

You might try Discus from Uwe Seimet. It does some of the same things as
ICD Pro, but better and in German. It replaces ICD Pro Cleanup for me.

There may be a demo version.

You might try pestering ICD. They have a reputation as being very slow,
but not completly useless yet.

And if all else fails, contact me off list, and I will zip them up and
send by e-mail.

Jim

With the drive connected to my Stacy via the Link II, I see the ICD banner on boot which displays the internal SCSI drive but not the extenal drive which it used to.

> Have you tried running the boot prog from floppy?

From STE and Stacy. Niether see external SCSI drive via Link II

> All the common boot progs, AHDI, HDdriver and ICD etc, put some sort of

Hi Rob!

A 'silly' question: After 'Install Devices', did you save the desktop? This should write a new NEWDESK.INF file with all the devices (and any program icons etc as well as installed programs) to the boot drive, which will be used next time you boot.

If this does not work, are you using XBOOT or STOOP configured to select one of a number of NEWDESK.INF files? If so, you have to copy the saved file, modified as necessary, to one of the entries. (I am doing this with XBOOT to have different options available for various resolutions and external disk set-ups).

Regards, /Peter/

TOS 2, 3, and 4 are quite similar. A good manual for 2.06 may be
downloaded at ftp://gem.win.co.nz/hall/tos_206/guide206.zip . It's
worth reading.

I've never heard of Link II failing, but I suppose it is possible.
I'd take up Barrie on his offer, but I'd also check the cable as I've
had a couple fail on systems that were not moved or altered in any
way. I know it sounds strange, but a new cable got it working again.

> What else is there that I might have missed?

1. Make sure you have a proper hostname pointing to the proper ip address for your PC. Make sure this IS the hostname that your PC is calling itself. In my case, the PC is called 'tonic' and the falcon is called 'dominant'.

2. Check that the folder(s) you intend to share are marked 'shared' in windows. Clicking "My Network Places" on your windows desktop should have a list of shared files and folders. If it's not in there...then you've simply forgotten to 'share' the directory.

I.E. I wanted my mp3 files in a lan shared directory...so I found the directory holding my mp3 files with explorer, right clicked it, selected sharing and security, and ultimately set it up for network sharing. Now, if I click "My Network Places" on the desktop...I see the folder listed as:

MyMusic on Windows XP (tonic)

Having done this, I now go to my Falcon and enter:

shlight //tonic/MyMusic /nfs/MyMusic

It asks for my password...and I'm in bussiness.

Check these things...they are pretty easy to miss. Took me a while to figure it out!

A little off topic...but quite worthy of mentioning...
This is a solution for the reverse...sharing things from your falcon to your pc.

I discovered that the built in XP explorer ftp client does a GREAT job of sharing the falcon drives with windows. It looks and feels pretty much like any other explorer window.
simply type:
ftp://root@falcon.ip.address in the run bar...or in the Address bar of an explorer window...OR...go into MyNetwork places and build yourself a little icon/shortcut that just click you in. That brings up your famaliar explorer window showing the directory of whatever ftp account you logged into...as if it were a directory on your PC.

One other tip...
The window's explorer doesn't seem to have a compatable parent directory option...so backing out of the root directory needs a symbolic link that windows can access via the explorer ftp client. In my case I did this on the Falcon.
ln -s .. BACK

Well...I don't know why...but I still can not SEE a file called BACK in windows explorer...BUT..it's there, shows up on the falcon shell and desktop and it

works like .. (parent directory) should. So...to get at the root of drive u:
where I can then jump to any partition on my falcon I do this on the PC.

ftp://root@falcon.ip.addy/BACK/

A windows explorer window opens, showing me the root of drive u:
Now I can browse everything on the Falcon from the PC, copy, delete, rename, etc
with files as if they were right here on my windows hard drive :) If I need to
back up and browse the current parent directory directory...I use the
explorer/browser back button...and it's all cached.

I'm not sure why, but doing this:
ftp://root@falcon.ip.addy/..
does not work...hence the symbolic link to .. named BACK.

Good luck,
Brian

3782. TT/Falcon/ST/PC/Syquest 270's

Newsgroup: comp.sys.atari.st
Date: 2002-12-04 05:28:52 UTC
From: Donald and Cheryl <dandc@merr.com>
Message-ID: <oogH9.41533$Hs2.5420453@kent.svc.tds.net>
Source record: 30742

I have these various machines and would like to be able to make syquest 270 meg removable disks readable between them all. HDdriver811 does not seem to be doing the trick. There are many errors after formatting for windows and tos when copying from the Ataris to these formatted disks. Any clues?

thanks for your time.

Donald

Yes, there is: http://www.seimet.de/diskus_english.html. But as you
already mentioned, there is only a German version with a German manual.

HDDRIVER definitely works. I'm so sure of that because I have been using
a 270 Meg SyQuest drive for data transfers between my TT and PCs
running under Windows and Linux regularly.
What you should simply do is create a single partitition that is
TOS/Windows compatible at the same time, as described in the manual. If
this does not work please contact me again and provide the serial number
of your version of HDDRIVER. We will find out then what's the problem.
It works for me and others, so it will also work for you :).

3787. Technical hard drive question..... I think (WAS - Ok, so if you see my previous post [how do I make my SCSi always)

Newsgroup: comp.sys.atari.st
Date: 2002-12-04 14:00:55 UTC
From: Rob <rob.jenkins2@btopenworld.com>
Message-ID: <oh2suu07kkdetfunu3u0f375s2erlaojpd@4ax.com>
Source record: 30745

Ok, so if you see my previous post [how do I make my SCSi always appear], you may see I couldnt get my external drive icons to always stay on the desktop.I decided that I would back up the entire contents of drive C to the new external Scsi drive I had (so I at least always had a copy) and then would format drive C and start over. [the reason for this was that there was it was a 2nd hand falcon, and there was a lot of software on there that I didn't know how to use, and didn't really know what it was (though I've backed it up anyway).

When I turned the computer back on, it booted up to a horrible resolution with only A + B drive icons and the trash icon. Having dug out my HDDriver disk (version 8, though I do also have v7.8) I managed to work out how to install the internal 6gig IDE drive.

I played about with the desktop resolutions, drive icons, colour etc and was able to save the desktop. I couldn't seem to get the external drives to appear though, and tried playing about on HDDriver a little more, and I was able to get them recognised in the program (though I obviously didnt want to partition them as I have the old contents of old C still on one of the three partitions.)

Going back to the desktop and even restarting didnt make a difference, I couldnt get the external Scsi drive to appear (though I could get the zip to appear, and the scsi h/drive was connected to that).

I found what I thooought to be a scsi driver in an auto folder on the hddriver 7.8 disk, and so put that in the autofolder on c drive, only now, when I turn the computer on, I can't get it to load to the desktop, it goes through the memory count, but then seems to just reload the same driver until it bombs out.

putting a disk in A drive doesnt force the computer to load that first, is that correct, or do I need to do something else to force the floppy to boot before the hard drive, and get me to the desktop so I can remove the two files I put in (both .prg's)

Thanks if anyone can help me out.... Rob

HDDriver can do everything you want. First install it in C dir, Menu Install
from HDDRUTIL.APP. Autoconfigure so HDDRIver sees the harddiscs and restart.
Everything should be working now...

I always do enjoy MyAtari, although I thought the "Back There" article
was needlessly depressing. Although I don't own a 2600 any more, I
(and my 7 year old) greatly enjoy playing the older games on our
800XL!

Hold down the Alternate key when turning on the Falcon.

Alternatively, another Atarian posted this procedure about 10 months
ago:

1. Switch power off and insert chosen floppy.
2. Switch on and *as soon as* the power led lights up, hold ALTERNATE
3. When the floppydrive led lights up, release Alternate.
4. Wait a few seconds, then press any key.

In any event, you need to read the TOS manual ASAP. Most of the
things you are asking are listed there.

Hi!

I was the person who posted that Silkmouse makes my system unstable.
First, I think I do have the older version you speak of, as that's the type
of adjustments that I can make on it. Second, it wasn't a matter of the
mouse pointer "creeping" or anything. It was that it caused other programs
to crash from time to time. I was having random unexplainable crashes when
using Magic. Someone asked that I send them my AUTO folder order, and when
they saw I used Silkmouse, they suggested removing it. This seems to have
fixed the problem. It was very random (any program at any time would crash),
and intermitant (I might not see it happen for weeks, then it would happen a
number of times, then nothing for a while). Since I stopped using it, my
system's been much more stable.

Funny you should mention it, I had weird problems too. Removing silkmouse
and putting up with NVDI was better. I haven't tried Maccel yet tho? Will
tryit out soon.
As a note both versions of Silkmouse did strange things. It was an awesome
program tho, pity.

FamilyNet Newsgate

I have a bulk of items that I would like to sell. What I have here is a Atari 1040 STE that is upgraded to 4 mb, and has a working hard drive and CD-rom (at least the audio portion). Will come with a SM124 (monocrome) monitor.
Has a working hard drive which has a working Spectre partition. (Running System 6.04 or 6.08.)

The setup has been recased in a PC case and has an external keyboard setup anyway from the case.

This would come with a good box or two of software and hardware and magazines.

Would be great to sell to someone in the local Dallas/Fort Worth area, but can talk about shipping arrangements.

Total setup and stuff will go for $150.00 (not including shipping), and if interested, I'll be happy to spell out all that will come with it in greater detail.

Thanks,

Doctor Clu

Agreed, but if you use the option of 'Whole report' in one of the
'File' menu sections, you can write the whole thing to a file or
clipboard, or print it out directly. Perhaps not as convenient as
being able to bring up the info in one of the cascading menus on
the screen, but a usable work-around.

I know this is not really the place for these reports, but I'm in a hurry
and could not find the authors address.

On both my Milan and Hades, the below message is given each time I try
starting it ;

pid 200 (CRESUS): MEMORY VIOLATION: type=free RW=r AA=22CD3C PC=1F2CDE BP=1C4000

This basically means the program tries to access memory it does not own.

I always run with Memory protection enabled, and regard the above as very
dangerous to system stability, therefore I post it here....

Yup, an STM. UK variety with external double sided floppy at a reasonable price.

The keyboard on an original ST or STM is far less spongy than later ST's.

Oh, can you run an ST on an EGA monitor with a standard RGB cable?

Cheers.

Hmm!

I know the ST & M's have a totally different keyboard, you cant use an STFM/E one with them.

My ST (external everything) still works ok, maybe they used a harder rubber or springs!!!

Steve,

> > - Foreword
>
> Why do you always out this before everything else.

Well, the majority of magazines you buy off the shelf invariably start
with a note from the editor. Our "Foreword" is just this! a note from
the editors which helps to set the scene for the current issue.

> > - ARAnyM: Atari Running on Any Machine
> > - Tip of the day
> > - The Future of Atari Computing
> > - Back There...
> > - MyIDE Interface Part 2

;-))

> Its been ages since you asked for articles, are you up to capacity now, has
> Shiuming run out of blue LED's yet, I've got a TV remote here that's not
> been ming'd...

As you can see from our recent issues, MyAtari is not suffering from
lack of articles. However, we are never going to reach capacity, so
articles and reviews are ALWAYS welcome! Shiuming and I are always on
the lookout for talented and keen Atari enthusiasts that would like
the opportunity to share their experience and enthusiasm with other
Atari users. If you are such a person, please get in touch.

I would just like to dispell a few myths about contributing to
MyAtari. Firstly, we are not looking for a long-term commitment
(although, that would be most welcome), so if you can only write one
article for us, that's ok! Secondly, MyAtari does have high
standards... but don't be put off by this as both myself and Shiuming
will help you as much as we can (you are not alone writing your
article, so do not be daunted).

Finally, if you really think you cannot write but have another talent
which you'd like to offer the magazine such as designing a future
cover for us, rounding up the latest Atari news, please get in touch.

Merry Christmas and a Happy New Year!

Matthew Bacon, Editor

P.S. Shiuming never runs out of blue LED's

I gather they used completely different keyboards. The latter were more membrance style while the STM's used real keys.

Anyone, does this indicate someone has an STM to sell or not?

I do have a Phillips monitor which I believe is fully ST compatible but the top line pulls at the top a bit.

> I gather they used completely different keyboards. The latter were more
> membrance style while the STM's used real keys.

I've missed some of these posts, but I gather the discussion is about the detached keyboards from Atari and that STM stands for ST Mega.

The Mega keyboard does indeed have real key switches. It's a heavy sucker, and built like a tank. Like the orignal ST's, it has the mushy feel, in other words, no tactile feeling of going "past center" when typing on the keys. Best Electronics used to sell replacement key switches that had the feel of definitely clicking. The were pricey, plus you had to solder each on to the circuit board after desolder the originals. In addition, the keycaps were larger than normally found on keyboards and typewriters. That generated some ire about making increased typos with the keyboard.

With the TT, Atari switched back to a membrane keyboard with standard sized keycaps. The tactile feedback (spring feel) was provided by small rubber cups that look something like a suction cup. This same idea was used in the original ST's. Best sells a kit, called TT Touch, that you can use in the ST's to give them the feedback similar to the TT.

For awhile, there was a company selling spring kits for the ST's that claimed to give the ST the tactile feel of a real switch. I bought that kit, to me it just gave a stiffer mushy feel to my 1040. I eventually put the TT Touch kit in all the keys.

The only difference between the TT keyboard and the STE keyboard is the color of the case. This is what I was told by my Atari dealer, and he often had an STE keyboard attached to the TT in his store.

As for interchangeability, the TT keyboard will work on a Megas ST. Been there, done that a couple of times when static electricity blew a chip on the Mega keyboard. It would seem logical that the Mega keyboard would work on the TT and STE also, but of course you would have to deal with no mouse and use keyboard controls for that.

Yea, I"ve had Atari's since the 8 bit days, with 2 Atari 800's which I still have.

Ken

Hi there,

I'm new to Atari equipment and was wondering if there is a way to boot an Atari 520ST with a hard drive connected, but not actually boot off of the hard drive? I got the hard drive for free and when the atari tries to boot from it, it gets to a certain point, and then resets and tries to boot from there again. I'm wondering if there's a way to boot the Atari using something else to get in and see if there is anything salvageable on the drive.

Any help is greatly appreciated!

THanks!

Brad

Try holding down the Alternate key until the desktop appears.
You might have to try a few times until you get the timing right.
Meaning at what point you press and hold the key down.

It might help having a blank formatted disk in drive A: to avoid any
delays while it looks for a disk.

3830. Script File Format

Newsgroup: comp.sys.atari.st
Date: 2002-12-07 15:20:12 UTC
From: msdemlei@users.sourceforge.net
Message-ID: <e5a0ecdf.0212070720.65945544@posting.google.com>
Source record: 30690

Hi,

I've got quite a bunch of old Script 1/2 documents (.STX) that I'd like to recover, if possible with as much formatting as possible. A "Save as Text" option from Script is not really an option, since I don't have a copy of the program, and also because I'd really like a bit more markup.

So I'm hoping that maybe somebody reading this has figured out the format or knows someone who has -- the program's author, Volker Christen, appearently doesn't have an E-Mail address, but there just have to be some people who know him (or knew him...).

Alternatively, I've read that at some point there was a "free" (as in magazine disk) version of Script II floating around. I guess that would be fine, too -- once I have the program running, reverse engineering the format would be quite a bit more feasible.

Or is there some STX2html or STR2rtf or whatever floating around?

Any hints appreciated,

Markus

Does the right light on the Link II still light up? Could be the
SCSI cable. That happened to me one time. I just disconnected the
cable, gave it a stretch and then put everything back together.
Worked fine after that.

What software do you use to boot the hard drive? You should have
HDDriver. I would just boot up the ST, then turn on the drive. Run
the HDDriver boot program, then install the hard drive icon. Click
on that icon and it should bring up what is on the drive.

From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3df247af.0@entanet>
Source record: 30596

Hi All,

I've been having fun getting up and running on BT Broadband.
I bought an ADSL modem a D-Link DSL-300G+ and waited patiently
for my phone line to be converted to ADSL. It only took about
a week but I had to wait a further 2 days for my isp to supply
my static ip address.

It was then that I found some info hidden deep in the modem
documentation. This ADSL modem uses DHCP so even though I have
a static ip address I think am going to need a router device
to connect to the modem unless someone knows anything about
a DHCP client for Atari ?

I haven't managed to configure the modem. The manual says a
javascript browser is needed but Draconis doesn't like the
script on the modems web-page. I suspect it need Java too.

I also discovered that BT Broadband uses PPP over ATM and
not PPP over Ethernet that is common on cable networks.
If am going to need a router then apparently it needs to
be able do PPPoA as well otherwise it doesn't work with
the modem. Does anyone know of such a router at reasonable
price ?

Regards,

Peter (still using a 56k modem :-(

I'm afraid that any DSL solution for an Atari computer will require a router of some sort. The reason for this is not DHCP since you already have a static IP but the software (PPPoE etc) required to connect to a DSL service. A cable solution with a static IP would be a better solution for an Atari user and I do know quite a few with such a setup.

As for PPPoA, I'm not familiar with that. For the 2 years I was in Canada working for an ISP, I never came across it.

There are really no DHCP clients for Atari that I know of but I think I have heard that MiNTNet might have a client of some sort. Again, DHCP is not something you need to worry about in this instance.

Usually DSL modems that can be configured act as a router as well. See if you can get the modem itself to do PPPoA for you. That will save you from buying a router. Sometimes DSL modems have a 9 pin serial connection to console into it using comms software and configure it that way. There are quite a few comms software for the Atari to do it. If your modem doesn't have a serial connector, you might have to find a friend with a windoze PC to configure the modem.

Feel free to email me with any questions.

Joshua.

That's DEFINATELY not true. GOOD dsl service (like Speakeasy.net in the US) doesn't use PPPoe or PPPoa crap. It actually works and never goes down. You plug the modem into an ethernet hub, plug the atari into the ethernet hub, setup your ip and gateway and that's it. Don't speak for all just because most people make the mistake of choosing poor typical consumer service.

I don't mean to sound harsh but people really really need to do some research if they want some decent service. At least in the US. I don't even really know how it is over the big blue ocean. I pay $100 a month for speakeasy with 6 static IP's 1.5mb/384k up and yeah, it's pricey and yeah it has *never* gone down. Not even for 3 seconds. with the exception of the world trade center attack.

But for the record DECENT non PPPo(anything) DSL service is available.

This would be the way to do it, but with PPPoA or PPPoE I don't think there exists a decent solution on the Atari. However with available PPPoe solutions for linux and bsd, I'm sure with a little bit of porting we could have such a solution (for mint).

Indeed. This is the solution used by my DSL provider. The DSL "modem" has
built-in DHCP (but you don't have to use it) and NAT, and all I had to do
to get online with all my computers (three PC's and several Ataris with
ethernet) was to connect the DSL modem/router to my network and set the
correct gateway and DNS server on my computers.

Date: 2002-12-07 23:31:10 UTC
From: cstanley@zetnet.co.uk
Message-ID: <3df284bd$0$250$4c56ba96@master.news.zetnet.net>
Source record: 30601

For those in this froup who have or had Zetnet.co.uk as their ISP:
you may know that Zetnet's analogue line has been switched off.

Instead, you have (in the UK) to dial the digital line 0845 604 2018.

Those using STiNG and its Dialler will get no response on the old line;
nor on the new line unless they reconfigure or use StiK (1 or 2).

My attempts with StiK2.03 gave only one success, subsequently failure.
Reconfiguring STing (1.26) for the new line is successful. If any wish
to see my STiNG default and dial files, please email me; or if you know
anyone with problems (having no other means of access).

There is always help on the Zetnet-atarians list.

Charles.

3844. Keyboard repair

Newsgroup: comp.sys.atari.st

I remember seeing pleas for help about failing keys, especially the Control key on the TT, over the past years, but could not recall the published solution.

In case the problem arises again (Atari Info Sites please copy), I have just found my print-out of instructions. They were by Mario Becroft and were downloaded, with a comment, from *Funkyware.Org*, July 1997.

Mario's site was http:/www.pl.net/user/mario/ or mailto: mb@tos.pl.net.

I followed his instructions and succeeded in repairing the mylar.

Thanks for your attention,
Merry Christmas,
Charles.

Edward,
I agree with you on this!!! You must save the
desktop to the HD. Especially to the bootup drive on
the root directory to make sure that the system will
know what partitions and drives are available espcialy
on a TOS setup. Not so picky with Magic 6.1 and
Jinnee though. I always disconnect my 4.3 GB Seagate
(because I only use it to backup my files once a
month) and put it in my lock box at the bank.
REMEMBER YOUR BACKUP IS ONLY AS GOOD AS WHERE YOU PUT
IT. So if your house burns down and all your
software is setting on the computer or in the same
room even if you replace the hardware your screwed
with everything that you had done on your system.
BTW, Edward how is your broadband connection on your
HADES 60 doing???

Thanks,
Carey Christenson

Adam,
I have had this drive for over a year and have had
NO problems at all. Besides that I have CD backups of
everything and a 4.5 GB Seagate 7200 RPM drive that I
use strictly for backups and it gets removed after
the backup process and put into my safety deposit box
at the bank!!! I have NO worries. Besides that I
was thinking of going and getting a 80 or 120 GB hard
drive sometime anyways since the 80 GB is getting
rediculously low almost to the point of what I paid
for my 40 GB drive over a year ago. Thanks for the
information though.

Thanks,
Carey Christenson

Anyone,
This next spring I plan on getting wireless
broadband internet that essentially uses FM antenna to
get a guaranteed download of 512K/sec with burst to 3
megs/sec and uploads of only 256K/sec are guaranteed.
I will be getting probably the top of the line APPLE
POWERMAC. I want to connect the POWERMAC and my
FALCON to a router and of course the modem to the
router. I have all ready purchased Lyndon Amsdons
ethernet card for my Falcon. My point is when I get
ready I may need some help from some of you experts in
here on this subject. I have been seeing alot more
post on broadband and internet connection for the
Atari. I have been pondering Sting 1.26 or MagXnet,
which is better??? I dont have a working MINT setup,
not even sure if I would ever want to go that way or
not. I am very comfortable with my Magic and Jinnee
setup that I am not sure that I would want to change.
Thanks and any feedback would be appreciated.

Thanks,
Carey Christenson

Source record: 30608

From: <local>
Date: Sat, 07 Dec 2002 20:20:14 -0600

Everyone,
Here is a ***NEWLY*** updated list of everything
that I have and some of what people have given me in
my e-mail. Thanks to all who have sent me there
favorite web-sites!!! This is meant as a good
resource for people to find web-sites related to Atari
computers. This list is by NO means complete and can
always be added to or deleted from if found that a
site is no longer operational. Please direct all
comments to me at firest@williams-net.com. Please if
you have any web-sites to add to this list by all
means send them to me and I will add them in. If you
find a web-site that NO longer works let me know and I
will check it out. I will do my best to update this
list at least twice a month and post in this
newsgroup. If this becomes to big I will break it
down into smaller messages and post each message every
other week as to not overload the newsgroup!! We as
Atarians must band together to help to ensure the
survival of our platform!!

I have several more web sites to add but I will do
them this weekend and post next week sometime. I have
not posted this resource for sometime and have felt
bad about not updating it on a regular basis that I
wanted to get it out there for everyone this weekend.
Main reason for lack of updates is personal, deaths
in the family have kept me pre-occupied. But I am
back and will do my best to post once a month or so.
Any comments please direct to me at firest@williams-
net.com.

Thanks,
Carey Christenson

3850. Tried the Alternate key for booting from disk

Newsgroup: comp.sys.atari.st
Date: 2002-12-08 03:04:44 UTC
From: Brad H <brad@socketcomputersource.com>
Message-ID: <gFyI9.174301$ka.4051104@news1.calgary.shaw.ca>
Source record: 30609

Hi there,

I tried using the Alternate key to force the Atari (520ST) to boot off the floppy instead of the hard drive. Didn't work though, it just goes to the hard drive and tries to boot there. Anyone have any other ideas? I noticed this Atari appears to have been modified.. the Floppy disk casing is somewhat banged up and there is what appears to be maybe an early PC floppy unit in there.

Thanks in advance for any help!

Brad

3851. Steinberg M_ROS Task Switcher

Newsgroup: comp.sys.atari.st
Date: 2002-12-08 04:01:21 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <KpzI9.52315$bq3.26513@news.bellsouth.net>

I have CueBase Audio Falcon.
The manual mentions an M_ROS task switcher that allows multiple MIDI apps to run at once, but I can't find any such thing on any of my CAF disks. Is this something that doesn't work with CAF, so left out at the last minute?

If anyone has it...perhaps from some other CueBase release...I'd sure like to try it.

Thanks,
Brian

I think (not 100% positive) older Atari's like the 520ST didn't have this feature. It was only when I got my Falcon (up from a 1040STfm) that I'd heard of booting this way to bypass the hard disk. Is SCSI or ACSI(?) "plug and play" such that you could remove the plug, boot from floppy, plug it back in, and run a hard disk driver from floppy to access the hard drive without screwing something important up?

I know for sure the [Alt] method works on TOS 1.4 and AHDI 3.0 (sic!) on
my Stacy. But you must press (and keep down) the [Alt] key at the right
moment. I guess that if it's already down when the keyboard controller
initiate itself it will not be recognised as down?

>> hard drive and tries to boot there. Anyone have any other ideas? I noticed
>> this Atari appears to have been modified.. the Floppy disk casing is

Could be a HD floppy mod. If so it should really be running TOS 2.06 and
you would have an Atari logo (if you read this with Atari charset) on
startup and a black "countdown" bar.

Which process is responsible for checking the [Alt] key? TOS or the
harddisk driver?

>I think (not 100% positive) older Atari's like the 520ST didn't have this
>feature. It was only when I got my Falcon (up from a 1040STfm) that I'd

Never tried a harddisk on TOS 1.2 or 1.0 but 1.4 definitly has this
feature if it's not handled by the driver (??).

>heard of booting this way to bypass the hard disk. Is SCSI or ACSI(?) "plug
>and play" such that you could remove the plug, boot from floppy, plug it
>back in, and run a hard disk driver from floppy to access the hard drive
>without screwing something important up?

Don't do that! His 520ST must have a separate power switch/chord to the
external harddrive. Simply power up the computer first and when the
desktop is up then power up the harddrive. Then run the HD driver
(AHDI.PRG or whatever) from floppy. Install the hd desktop icon, remove
the offending program, install a bootselector program and reboot. Then
you will never have this problem again.

The delayed powerup method is not very practical on the Stacy btw! That's
the reason I know for shure the [Alt] key works with it...

I remember it was already uncertain if Cubase 3.1 would support the Switcher. I've never tried it with CAF because it works only with programs that support MROS (that is mostly Steinberg programs and EPSS). The only one I have is Avalon and that doesn't work with my Falcon's SVGA monitor.

But if you want to try it, I'll send it. I believe it's also available on http://groups.yahoo.com/group/atari-midi/files/ but you need a manual (I have one).

Cheers,

Jos

What hard disk driver is installed on your ST? Try holding down the
Control key instead, this will boot from the hard disk but will skip any
programs in the auto folder.

Hi,

The D-Link DSL 300G+ modem can do PPPoA, PPPoE, IP over ATM (RFC 1577) and Ethernet over ATM (RFC 1483). BT happen to use PPPoA so I just need to configure the modem to that setting. Telewest (my local and only cable supplier) use PPPoE.

If the ADSL modem I bought didn't force DHCP I am sure I could get this working without a router but I didn't know this when I bought this modem.

* What DSL modem do you use ?
* Does it support PPPoA ?

I don't need to have an in-house network so I would prefer to do this without a router if I can. I might swap the ADSL modem if there is a better alternative.

I am learning as I go and I've learnt a lot from the guys on the Atari Clones list.

Regards,

Peter

Only my TT's keyboard is not working, not because of the mylar, but because the tabs broke off on the back of the main plastic part and it no longer holds that metal plate so the keys work.

I wish my car hadn't blown a water pump, I was aiming to get a keyboard by now, but life just had other ideas.

3861. HD Driver disk

Newsgroup: comp.sys.atari.st
Date: 2002-12-08 19:35:33 UTC
From: Brad H <brad@socketcomputersource.com>
Message-ID: <9aNI9.179638$ka.4162633@news1.calgary.shaw.ca>
Source record: 30620

Hi there,

Anyone know where I could obtain (if it's legal) an image of a boot disk
that would have support for the external HD (it's a Supradrive, btw) for my
520ST? I don't have any around as I got the system second hand.

I'm assuming the TOS ROM on my 520 doesn't have the ability to recognize
hard drives, since it hasn't thus far?

Thanks again!

Brad

You don't have to disable DHCP in the router, just ignore it and set up
your computers with fixed IP adresses. Set the router's IP adress as the
default gateway, and use the DNS server supplied by your ISP.

> * What DSL modem do you use ?

A Cisco 677i-DIR

> * Does it support PPPoA ?

I don't know and don't care, as it was already set up when I got it ;-)

Well, you could actually support one of the few remaining Atari developers in business and actually buy a copy of HDDRIVER.

Or, if you look around, you can find Atari's hard drive utilities on the net. Not the best, but they should work.

Hi All

Dr Ambient has now released a major update to his AEX (Tangerine Dream machine) application. I have been the Beta tester and I have to say, this new version is remarkable. It is now in 2 voices plus a percussion section. Lots more algorithms, a Copy to Function key/snap shot feature, immediate transpose, a very sleek graphic look including a new AEX logo with the 3 tangerines in the corner as well as a transport bar. This version also includes 16 color support so the program can be run on TT's as well as falcons.The 256 color version is however the better. I have also had the preveledge of actually coding most of the algorithms for Voice 2 as well as the percussion patterns. Thanks Dr!

Please print out the page for documentation. We will be expanding on the documentation as well, so look for it.

http://tamw.atari-users.net/aex.htm

Have fun with the new version of AEX. Comments welcome.

Try holding down SHIFT as you boot, most Supra hard disk drivers would
bypass startup from the hard disk if you did this.

3871. Supra 20MB

Hi again! You guys are awesome... not used to people being helpful.. hehe.

Okay, I have yet another question. I have a Supradrive 20mb. I understand it's a SCSI? Does that mean that I could potentially take the 20mb drive out, and put say, a 300mb regular 50pin scsi in old casing? Anyone know if the connectors (power, scsi) are standard in there, and if it'd work?

Thanks so much again, you guys have been really helpful.

This is quite possible.
If the drive inside is an inlaid SCSI I type drive, then yep...you can replace it with a more modern SCSI I or SCSI II mech. Possibly even SCSI III with an adaptor.

If the drive inside is MLM or RLL, then no.

If you have some SCSI mechs laying around that you'd like to try, these are the main things to consider with many of the Atari ASCI to SCSI hosts.

1. Be sure that parity can be disabled on the drive (usually via jumper). It's most likely that the Supra host adaptor isn't going to support parity.

2. You may have to experiment with Termination power settings. I'm not sure if the supra hosts provide term power or not. Some devices need this in order to work. Most devices living up to SCSI specs can provide their own term power if/when needed (again via jumpers). Many can even be configured to supply term power to the bus. If for some reason you discover you need term power and can't get it from the adaptor or some other SCSI device on your chain, then it can be added...grab 5v from somewhere (your power supply or from the joystick port, etc..) and add it to pin 26 of the SCSI bus.

3. I doubt the Supra Host will support SCSI arbitration. Some drives need this or you can't boot from them. Avoid these type drives.

4. Stock TOS/GEM only supports so many partitions up to certian sizes. This can vary from machine to machine, host to host, and driver software. To access really large drives you'll most likely want to get HDDriver.

In general...with these older host adaptors...you'll want to stay with drives 1gig or smaller. Zip drives should also work, but keep in mind that alot of those need an external 5v term power source on pin26 of the SCSI chain.
HDDriver is definately recommended for removeable media!

You can find my email on my homepage, where you have downloaded Cr&#65533;sus.

> This basically means the program tries to access memory it does not own.

No, or else MagiC should have caused also an alert and a program end.

The problem comes from the GFA init part of which I'm not responsible.

> I always run with Memory protection enabled, and regard the above as very
> dangerous to system stability, therefore I post it here....

Cr&#65533;sus is compiled with the patched (1.07) GFA Compilator, which is not
compatible with MiNT memory protection. Same problem with others of my
programs.
I should have used the LicomLIB from www.rgfsoft.com, which is compatible
plainfully with MiNT, but this library has a bug which fragments the memory
at program end. 'Tis a niggle under MiNT or MagiC, but very obstructing
under monoTOS. So I had to make a choice and prefer monoTOS rather than MiNT
with memory protection (I think Cr&#65533;sus works well under MiNT without MP).

>which is better??? I dont have a working MINT setup,

You have to ask yourself whether you wish to keep using Emailer.

If so, you should install MagxNet and email Vassillis to ask for a beta copy of his IConnect gateway. Once you've got it set up it works very well. You should also consider how you will use the LAN that your proposed setup will provide - I have Vassillis' ftp server on the Falcon so can use an ftp client on other computers on my LAN to grab files.

I don't think that you need consider MiNT at all :-)

Cheers

Derryck

I don't know what kind of casing is on Supra hard drives, but they also made a removeable floppy drive, the FD10), that held 10 megs. The drive was made by Konica, and was SCSI. The back of the shoebox case had both ACSI and SCSI connectors built in.

HDDriver supported the Konica but as a 20 meg drive. (Maybe there was a 20 meg out there somewhere, I don't know.) But I was never able to get HDDriver to format my FD10 drives.

Magic does not support memory protection like mint, your program will
react differently under mint with MP enabled.

> The problem comes from the GFA init part of which I'm not responsible.

It's possible to write MP clean apps with GFA. aIRC run fine under MP and
MiNT and is all gfa code.

I use this same patched lib, works great with memory protection.
Memeory protection requires more work on the coder end, one has to detect
mint and pass the correct MP bits only for MiNT. I am assuming you do not
do this?

> I should have used the LicomLIB from www.rgfsoft.com, which is compatible

LicomLib won't solve a MP issue, the built in malloc() is not aware of
MP. You need a binding to mxalloc() to solve the problem. ;o)

Salut :)

> > No, or else MagiC should have caused also an alert and a program end.
>
> Magic does not support memory protection like mint, your program will
> react differently under mint with MP enabled.

I know MagiC and MiNT memory management are very different... I meant to say that if I had a write outside my allocated memory, I should have seen it. I have some of these bugs when coding and MagiC is very strict on it : alert + quit.

> It's possible to write MP clean apps with GFA. aIRC run fine under MP and
> MiNT and is all gfa code.

I know but something was missing in the counsels you gave me about this problem. didn't work at all so I gave up: I'm not a mint-fan.

> I use this same patched lib, works great with memory protection.

> mint and pass the correct MP bits only for MiNT. I am assuming you do not
> do this?

No. That's the "missing" point ;p
How do you do this ? with a mxalloc ? when ? never saw it in my dev-docs, is it MiNT special feature ? since what version ?

> LicomLib won't solve a MP issue, the built in malloc() is not aware of
> MP. You need a binding to mxalloc() to solve the problem. ;o)

Using LicomLIB has solved this problem without changing anything in my sources. But, as I explained above, I can't use it.

Thanks for the post :)

Well, there is no doubt that this definately is accessing memory you do
not own. I program ASM only under MiNT, and I know a lot about pointers
going wild ;-) MP saves my system from going down just because it kills
anything trying to access anything outside of its own translation tree.
You should listen to Lonny when it comes to experience using GFA and MiNT
with REAL memory protection :)

Do you have the compendium? If not, let me know and I'll send you info
about the mxalloc() call. I think even newer TOS versions (at least TT)
have mxalloc(), with which you can select what kind of RAM you want, like
TT, ST, prefer TT and prefer ST RAM.

Why not work it out? You and Lonny can make it better if you cooperate
and make it clean. We can't have apps that read/write memory all over the
place ;-)

I can't find an DHCP client for the Atari. I use a router with NAT and just
reserve and address for the ATARI.
Note that its not always obvious if and how you can reserve static addresses
in ADSL routers so it may be worth asking the supllier if it will do what
you want before you buy.

> I haven't managed to configure the modem. The manual says a

I suspect many of the routers will need this type of browser. Also Not sure
what type of Atari you have but my TT with CAB and the Lyndon Etherenet is
not fast enough to take real advantage of broadband. Its just too slow at
rendering JPEG files etc. I would look at a cheap PC running Linux if you
want to avoid MS.

There are a number of such routers. I use the Alcatel but its not cheap.
For cheaper options see the Solwise range, but again these may need a PC to
configure.
www.adslguide.org is a good place to start looking at routers.

>TT, ST, prefer TT and prefer ST RAM.

I have (bought) the compendium, but it's very bad to see the long HTML
pages under CAB and my Falcon+Eclipse. So I prefer use the TOS.HYP and
others dev-docs.

I have studied and use mxalloc for TT-RAM allocations (blind use: no
TT-RAM to test). And seen this late afternoon the MiNT part of this
function: I understand nothing in the monography, and need some
lines/example. The header of the GFA program must be changed/patched
with this mxalloc in the GFA init part: how can I control this
moment? Since it's before all GFA instructions in my source, I cannot
see how to handle it :(

>Why not work it out? You and Lonny can make it better if you cooperate

If the only problem is the way to allocate RAM, this problem should be quite posible to solve. I am sure Lonny will be able to explain the details of setting up a bitmask for useage with mxalloc. I don't have the details handy right now, but know it is an easy fix to handle mxalloc under memory protection.

Note that you really don't have to reserve any static ip addresses, just
avoid using them on any other computer on the network. I have been using
a Netgear RT314 "Broadband router" or NAT-box for a couple of years now
with a couple of pc's and Ataris with DHCP enabled and it works fine. To
be sure the ip will not be used on any other computer choose a higher
like 192.168.0.129 or so. Often the DHCP server will start from
192.168.0.2 so from 192.168.0.6 and upwards will be OK if you have four
pc's.

>I suspect many of the routers will need this type of browser. Also Not sure

My RT314 is fully configurable from Atari via Telnet. This is also a much
faster way compared to using a browser.

>what type of Atari you have but my TT with CAB and the Lyndon Etherenet is
>not fast enough to take real advantage of broadband. Its just too slow at
>rendering JPEG files etc. I would look at a cheap PC running Linux if you
>want to avoid MS.

Partly agreed! I use my Atari TT for all news and mail (virus free!) and
also lots of surfing by clicking on url's in mail/news posts. As there is
no extra "online fee" I can wait while CAB renders the pages.

On the other hand a 500 Mhz pc is realy much better and more compatible
for lots of web pages. With the Microsoft dominance you simply must have
at least IE 5.5 sp2 or you will be locked out of lots of things. And it's

of course OK to use MS products as long as you don't pay anything for
them :-)

The Lyndon EtherNEC actually can fill my 500 kbit/sec connection simply
by downloading files with CAB on a TT.

Everything runs considerably faster with EtherNEC compared to 153600 bps
nullmodem that I used on this TT before.

>> I also discovered that BT Broadband uses PPP over ATM and
>> not PPP over Ethernet that is common on cable networks.

My provider simply uses "bridged Ethernet" where the user must obtain an
ip address via DHCP and then manually "logon" on a Javascript webpage. As
long as you renew the ip address you will stay "logged in". This means I
can keep my pc off and only have to power it up if my link has gone down
for some reason. The RT314 takes care of the ip address renewals.

>There are a number of such routers. I use the Alcatel but its not cheap.
>For cheaper options see the Solwise range, but again these may need a PC to
>configure.

May I suggest that you by a separate NAT-box (broadband router) with
built in switch and four tp connections. If you buy a combined ADSL
modem/router you may get into trouble when the ADSL technology gets
obsolete. And no USB!!! this goes for both Atari and pc use!!

You don't have to write outside your memory area to have problems. If your program allocates all ram as private by default for say an av protocol buffer, then when you pass the pointer the receiving app will be killed. This is a comman problem under memory protection. Such buffers need to have their access set to global, then the other app can access it with no problem.

>> It's possible to write MP clean apps with GFA. aIRC run fine under MP and

Mxalloc() is in all tos since version 1.4, so it's not what I'd call mint specific. I am not a magic-fan, but I make sure my calls to mxalloc() are free of MP bits under magic, since magic doesn't use them.

>> I use this same patched lib, works great with memory protection.

It's really rather simple, mxalloc() has an extra parameter to control who can and cannot access a memory block. If you do it right you can over-ride the header bits and just forget those.

>> LicomLib won't solve a MP issue, the built in malloc() is not aware of

I never had the memory leak problem you mentioned with licomlib.
My main problem with it is I cannot fully grasp the german docs.
So I don't use it.

Heads up to all.

B&C has had some problems with their email servers since Dec 1st. If you made any inquiries or order requests since then, they probably didn't get the email.

Email addresses affected:
atari@myatari.com and sales@myatari.com

They ask me to get the word out that emails can be sent to myatari2@juno.com until they get the mail servers back up.

They're sorry if this has caused any inconvience to anyone trying to place an order.

You can visit their website at: http://www.myatari.com.

Glenn

Hi All

I am covering the NEW version of PULSAR (Pulsar 2)in the new December issue of My Atari (on-line magizine)The download is available as well. This version also contains MIDI Spy, as you can use it to capture Pulsars Output and save it as a MIDI file.

The article is also a Tutorial on how to use Pulsar, which has not been done yet. It might be best to print out the article when using the new version.

Neil, however tells me, he is still planning GREAT things for Pulsar! So stay tuned!

http://www.myatari.net/issues/dec2002/pulsar.htm

Also check out the new issue as well:

http://www.myatari.net

Looks like lots of Version 2's this month! I think its great that we still have dedicated people who still code for us in this day and age of 2002!

ATARI Lives ON! YEAH!!!

Please excuse if this posted twice!

Hi All,
I'm having fun using JOE to build some web pages (great program).
So far, so good with the very (VERY) basics. In my travels around HTML
code sites I see login scripts (username/password) that need a program at
the ISP (ex. Perl) for it to function. Is there a script/program that will
function within a website and independant of an ISP ?
Mote: Must run on an Atari.

I am aware of this since a long time. I can assure you all memory for AV protocol or data exchange are in global, not private (I took the several codes/samples on the net to include in my code), this is why I started to use the GEMDOS(68).

The problem is that the Cr&#65533;sus (or Joe, or DGEM, or Rosemary, etc)'s MP crash occurs at start, during the GFA init.

My memory allocations seem to come later. What is means exactly MX_HEADER (that seems to be the path of the solution, since I think the problem is in the header of the PRG, builded by the library, not coming from my code)? Is the bit 3 of mode must be always active for MiNT (never aware of it, may be the cause)?
Thanks for the help :)

> I never had the memory leak problem you mentioned with licomlib.

'Tis a very very dim niggle in a multitasking OS, but in monoTOS where memory fragmentation is a curse, you loose 2-300Ko (more or less the size of the PRG file) every time a program (compiled with this library) is launched and quit. A small ~600bytes is left in the memory, fragmenting it. You can't see it if you have plenty of memory, but that it was obvious on my MegaST4 (TOS1.4+NVDI+Newdesk: 2 Mo free for user), during the tests. At a moment I had no more memory to launch my programs. And I compared with the GFA3PLIB with the same sources: no effect of this kind.

Regards

Pierre

Interesting observations. Have you mentioned them to Richard Gordon Faika?
If not, I am sure he would be interesting in hearing about these syndromes.
While I use the updated licomlibs, I haven't yet noticed the scenario you describe,
but it sounds like it might be worth looking into this.

Regards,

Joakim

Salut :)

> Interesting observations. Have you mentioned them to Richard Gordon Faika?

Twice: when I have discovered the niggle, and after the next upgrade (the last "GFA package from RGF" but I'm not sure).

> If not, I am sure he would be interesting in hearing about these syndromes.
> While I use the updated licomlibs, I haven't yet noticed the scenario you describe,

He may have corrected it, but I'm not sure. I was a bit dissapointed by the results in the upgrade, and I gave up. I can't blame him coz he has others things more important to do, and his programs are too powerfull to be used and wasted in monoTOS.

Hello Atari users,

I made a simple program to test the PCI bios:
http://membres.lycos.fr/pmandin/download/pci2.zip (49 Kb).
(bugfixes since previous version)

If you have a Medusa, Hades, Milan, or any other machine which has a PCI
bios, could you test it. Thanks.

Sources are available (115 Kb):

I usually use Photoline (I had never heard of Chagall until recently).
The CLUT and histogram stuff doesn't make a lot of sense to me. Is there
any info about how to use these features. The manual is pretty basic.

This is sounding like a library problem. Interesting. I may download your
program and runs some tests. The patched lib I use runs very nice under
mint. Ozk runs MP all the time with my program running for many hours.

> My memory allocations seem to come later. What is means exactly MX_HEADER

> Thanks for the help :)

Yes. Book states:
bit 3 If set, refer to bits 4-7 for memory protection
advice, otherwise default to protection specified in
program header. This bit is only valid in the
presence of MiNT.

If you set this bit then the header is ignored. This way the user cannot
fiddle with the header, set it to private and then cause the prg to fail.

Oh, I see. I would not notice that here with 128mb of ram on my Hades060.
That is certainly a problem that needs looked after.
Thanks for the detailed info.

Erm, no! This sort of thing can only be done with server-side scripting
/CGI (dependant on your ISP - although if you use a standard method then
it will be portable across ISPs as long as they support that method), or
client-side scripting where there is no Atari support.

I don't think cookies can be created without some sort of scripting?

PS. It can also be done by putting pages into a secure directory on the server whereupon the browser will ask for authentication before retrieving anything from that directory, but again it depends on the ISP. And I've had limited success with accessing secure directories with CAB - it asks for a username but fails to authenticate, maybe it's something to do with the CAB.OVL.

Indeed. I do not have a low memory machine here, so it's not gonna
show up until _many_ hours later if at all. Lowest ram setup I have is
74mb. Can you verify this problem perhaps?

How do you Telnet to the box ? Over the LAN cable ?

My modem has a "console" socket but it doesn't have serial D-9
connections. I've just tried to Telnet to 192.168.0.1 but it doesn't
find anything. I am going to alter my rc.net and see if I can Telnet again.

>May I suggest that you by a separate NAT-box (broadband router) with

Like I said, I all ready have an ADSL modem but because it uses a DHCP
server as standard I will need a DHCP client somewhere, either in
a separate router or as an Atari DHCP client daemon.

I don't quite understand your "trick" of using a higher ip address.
Do you think this might work with the DHCP server in my modem?

> And no USB!!! this goes for both Atari and pc use!!

Even the PC users I know said avoid USB.

Hi Chris,
Thanks for the feedback. Do FTP logins work similarly?
I had a site built that had a lot of files with vt and hta and I seem to
remember a password in there somewhere /:). I made some changes to the site
using JOE and transfered it all over to another ISP via FTP. It's running
the same without the vt and hta files so it seems they were'nt being
used and made no difference regarding logging into FTP.

Oh, you see, I'd need to have the program for that (and be able to run
it in some STonX or somesuch) -- which I don't have. Also, I'd rather
spend an hour or two coding a converter that can do this in batch than
clicking for an hour or so...

Still, I understand that even the ancient Script II could write RTF, right?

Hi All,
2 questions:

1- Anyone know if a list of color codes with the color names is available anywhere? (preferably free). Not sure if it's hex or decimal but here's a sample:

#00CCFF" link="#FF0000" vlink="#FF0000" alink="#FFFFFF"> Light Blue

2- Is CAB able to display more colors than what it's menu offers?
The HTMLTAGS.TXT file shows around 200 possibilties but the menu shows only 16 available even though my rez is set for 256.

FTP logins are different. You have an account on the server (for the sake of argument, let's say it's Unix) and can log into the server as though you were logging in at a terminal - that's telnet really but it's the same principle for FTP.

When you log into the server using FTP, you are using your own account name and password and you have total privileges in your own directory. On a Unix server, you could then 'chmod', or change the privileges on various directories, to make them secure via HTTP (a web browser) - that's how you make a directory secure as detailed in my second response.

I'm not familar with vt and hta files, although I know that htaccess is certainly a method of restricting access to HTTP calls. I think it's specific to the Apache web server software??

When a user requests page via HTTP (a browser), he gets assigned an anonymous username. By restricting access via one of these methods, he is required to authenticate with a valid username and password.

Or you can program usernames and passwords via server-side or client-side scripting as I've mentioned before. In that situation, you are in charge of a username database yourself - you have to program into your pages a username/password lookup and then allow the page to be delivered to the browser.

I think that's it in a nutshell!

BTW I have done some secured websites in work. If you try http://admint.bangor.ac.uk/cardenq/ then you should be prompted for a username and password by your browser (I'm not telling you what a valid username would be!). Here, I'm using directory permissions on a Windows NT server, where that directory can only be accessed by a certain user group that I've set up in the operating system.

A different method was used by this site - http://admint.bangor.ac.uk/recruit/. This time, you get the first page but have to enter a username and password into a HTML form. When it's sent to the server via CGI, it is authenticated against a database that I've programmed.

>How do you Telnet to the box ? Over the LAN cable ?

Exactly! I simply enter 192.168.0.1 in TELSTAR.APP (a STinG ip-stack
program). This is a documented feature of this NAT-box.

>My modem has a "console" socket but it doesn't have serial D-9
>connections. I've just tried to Telnet to 192.168.0.1 but it doesn't
>find anything. I am going to alter my rc.net and see if I can Telnet again.

You chould need to change anything really... On the other hand my Alcatel
ADSL modem (separate from the NAT-box/switch) only responds when the
connected computer has a specific local ip address (Can't remember which
at the moment). But this is only for special configuration purposes and
the modem itself off course has no ip address at all under normal working
conditions.

>>May I suggest that you by a separate NAT-box (broadband router) with

>
>Like I said, I all ready have an ADSL modem but because it uses a DHCP
>server as standard I will need a DHCP client somewhere, either in
>a separate router or as an Atari DHCP client daemon.

Are you shure aboute this? An ADSL modem should not deal with DHCP or ip
addresses at all! Think of the modem as a converter from Ethernet to
analogue signals that the telephone line can handle.

At the other end of the line in the "telephone station" (or whatever it's called...) there may very well be a DHCP server running and from which you get your ip address. In my case I must have a DHCP client on my side that gets my single ip address. This client is the WAN (Wide Area Network) side of my Netgear RT314 NAT-box.

>I don't quite understand your "trick" of using a higher ip address.

It is note that much of a trick, really. You can either set your computers to use static 192.168 addresses or let the router DHCP server assign ip addresses automatically. You can mix freely between static and dynamic (DHCP) addresses among your computers. But you should make shure to select static addresses that are not inside the range of addresses that your local DHCP server chooses from. All this is on the LAN (Local Area Network) side of my Netgear RT314 NAT-box.

Right at this moment I have one Atari with static 192.168.0.129, another with static 192.168.0.9 and a pc that has got 192.168.0.2 from the NAT-box DHCP server, all on the same 255.255.255.0 Ethernet network.

>Do you think this might work with the DHCP server in my modem?

Again, no DHCP server in ADSL modems! But, if you have a combined modem/router/NAT-box then you will most likely have a DHCP server that can serve local computers with 192.168.0 addresses.

If you really need to setup your ADSL modem (or whatever it is) get yourself a P-133 Win-95 osr2 computer with 32 MB RAM and install MSIE 5.5 and then spend a few days to run all the various security updates and service packs. After that you should be able to surf both the Internet and any configuration pages. A computer like that should not cost anything at all these days. Actually you should be able to find even faster pc's for nothing as they are next to useless for the average Windows lover...

3917. Re: DHCP, ADSL Modem & Routers [was Cab

Newsgroup: comp.sys.atari.st
Date: 2002-12-10 22:49:38 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <8ZtJ9.14719$X%3.2737@news.bellsouth.net>
Source record: 30526

If the adsl modem isn't also a swticher...I don't understand what the fuss is about DHCP. Use the proper type ethernet cable, as there are two basic types for the RJ type, and possibly even COAX (see your modem's manual) and connect it to your ethernet adaptor. Then, if your modem can do this alone (without the help of windows or somesuch drivers) you need to configure it with your account login information (often requires a Windows, MAC, or UNIX box with some sort of firmware installer...I.E. tftp).

Next you need a gateway...if this is not defined by your modem or the ISP, then a default 0.0.0.0 with a netmask of 0.0.0.0 should work just fine. Now make sure the last line of your route.tab in your STING directory looks something like this.

0.0.0.0 0.0.0.0 Ethernet 0.0.0.0 <----(Replace this last set with the gateway instead of zeros here if defined by modem instructions or isp)

Next, give your Atari an ip number in the sting PORTS CPX. Make sure the ethernet driver is showing and the mac address has registered. It usually doesn't matter what ip you use so long as it's in a private network range...I.E. 192.168.xxx.xxx, but see what your modem manual has to say about this.

Finally, you'll need a DNS entered in the STING control panel. In general the ISP gives this to you...some modems will fetch it automatically and in turn you use a 'gateway' for the DNS. In most cases...even if your modem can grab all of this info upon connection, you can still use the true DNS address if you like.

It's highly likely that you need to set your modem up using a PC for the first time. Here you will upload firmware drivers, tell your modem account information (how to log in) and if it should connect always, or only connect upon network activity, etc. Some adsl modems are more 'software' based than others...thus reqiring constant driver attention on a modern PC. If this is the case...you'll ether need to add a PC, or...a nat router/switcher box that can hold your modem drivers in static ram and run it.

In my case...I use Vigor 2200USB router switcher. An Alcatel USB adsl modem plugs into this box, of which I had used a PC to upload the modem drivers and such into (so once it is set up...no PC is needed anymore). The Vigor has 4 ethernet connections...thus allowing a small LAN, a basic NAT server so all TCP/IP aware computers on the LAN can share the one internet connection, firewall capabilities, dhcp server (optional and mixable with non dhcp clients), RIP, VPN, and much much more. Vigor also makes a router almost identical to the 2200USB but for modems with the standard ethernet type connection. Perhaps something like this is what you need.

The reason I went the USB route is because that's what my phone company sent me (for Windows). It worked very well for quite some time before I ever added the

Ataris. Later (on this very news group) I learned about the DraTek Vigor routers that supported a modem I already owned...so I got the thing, and it works just grand ;) Chances are that Vigor, or any number of other router/switcher/hub makers have an inexpensive box that will get you online with your current modem too.

http://www.draytek.co.uk

Hope this helps.

Anyone,
Does anyone know if 68 pin SCSI Seagate HD will work on the Falcon 030??? I can get a 68 pin 7200 RPM 36.7 GB with a 4 meg cache for under 50 dollars. Cant hardly turn that down!! Any input or feedback welcome. I think I found an adapter that goes from 50 pin male to 68 pin female that will connect my ribbon cable to the hard drive.

Thanks,

It should work...
May have to play with jumper settings.
I have an UW SCSI drive on my Falcon...
To ultimately get it working, I had to have some other drive on the SCSI chain set to "provide SCSI term power to self and to bus."
I'm not positive that's what the problem was...but after making said adjustment, the drive began to work without a hitch :)

Just be aware the Falcon can only see so many partitions at once and isn't really crazy about any partitions over 1gig. Using a recent version of HDDriver does help reach the full potential of such a large drive.

That sounds great! Unfortunately, those particular web pages don't
appear to exist any more, and Mario's current pages don't have that
repair info. Would it be possible to repost it? (If it's too lengthy
for you to type in, I'd be happy to post it myself)

Thanks in advance :-)

68pins means it's a Wide device, however it will work with a Narrow (50pin)
host adapter no problem as long as you get the correct cable (68pin->50pin).

I believe that this is a function of GEM, as I understand it although 256 colours are available your are still limited to 16 for the desktop/desktop icons and so your 16 available colours may be linked to this limit depending on how CAB interacts with GEM while still allowing you 256 colours for images as the image rendering as displaying is performed by CAB and not GEM.
You can probably set the colours any of the 256 colours available to you though your only method of doing so may be to change the colours used by the desktop itself.

The values used for setting link and font colours are in Hexadecimal (Hex, 0-9 then A-F giving 16 values) and contains 6 digits (two for each primary colour Red, Green and Blue) #RRGGBB where the left digit of each pair is the major part and the right digit the minor part representing coarse and fine colour adjustment respectively.
As a rough guide FF=full colour, CC=80 percent brightness, 99 = 60 percent brightness, 66 = 40 percent brightness, 33 = 20 precent brightness and 00 = none of that colour

For colour charts try...
http://www.webtemplates.com/colors/ - this site has a colour square of 256 colours, click on it to display the code for the selected colour (appear no a new page) or
http://www.24hourhtmlcafe.com/colors/ - this site contains chart of 256 colours with their colour values written on them, note that the names available to select the text colour are all valid colour names for browsers that accecpt written text for the colour eg alink="Blue"

(see the page source code), I believe that Light and Dark prefixes for these colours also valid although I am unsure if CAB will recoginse this or how it deals with colours that are not one of the 16.

Sorry if I have covered some items that are obvious to you but I though it best to be thourough.

3930. new gfa compiler patch for newfatfs users

Newsgroup: comp.sys.atari.st
Date: 2002-12-11 13:44:17 UTC
From: lp <gfa@basic.net>
Message-ID: <BA1CAB61.AFC7%gfa@basic.net>
Source record: 30540

For those that do not use licomlib.

GFA-Basic Compiler Patch v1.00 is now available.
Fixes the double extender bug in the original GFA-Basic Compiler
(GFA_BCOM.PRG). Will also fix a compiler previously patched with GFA-Basic
Patch v1.07e (GFA_PCOM.PRG).

This bug caused the compiler itself to fail under MiNT with newfatfs.
Reporting something like 'test.gfa.gfa' not found.
I think it also will solve the same failure under magic with vfat, but I
cannot test that. I've not tried it with minix, or ext2 either.

Note: Patch only works on English compiler v3.6 TT E since that is the only
one I have to work with.

If it does not work the first time, you may need an adapter with
termination for unused lines. There are both types, with and without.

To me all the networks are setup OK and also in a rather "conservative"
way without anty tricks...

>>TT3, MSTe, Stacy, Mega4:
>>0.0.0.0 0.0.0.0 [Interface] 0.0.0.0

>so I would assign the gateway fields to be 192.168.0.XXX, XXX being the IP
>addresses appropriate ports on TT2.

Not needed because these computers only need a default route and with a
nullmodem cable the gateway is always at the other end of the cable.

I suppose it should work with a default route like this on MSTe
192.168.0.200/29 network:

0.0.0.0 0.0.0.0 Midi 192.168.0.201

But it does work perfectly without an explicit default gateway.

>>Command on PC1, PC2 and NAT-box:
>>route add 192.168.0.192 MASK 255.255.255.192 192.168.0.129

>Hopefully you did not forget to specify "permanent" switch (something like
>"route -p add") so that the routing was not lost after next reboot.

I'm not aware of this switch. I used the documentation in "Windows 95
Resource Kit" where this switch is not described.

I simply let Windows execute the command by putting it in the Autostart
folder. Works well.

>>TT1:
>>192.168.0.240 255.255.255.248 Ser.2/LAN 0.0.0.0

>are conflicting. E.g. you are supposed to be permitted to have up to 62

As ROUTE.TAB is read from top and downwards this should not be a problem?
Anyway it does work well. I did however add this later on and to avoid

rerouting everything else simply used a "free" network that really would
fit more beautifully on TT2.

>nodes on the ...192 subnet (...192|1 to 192|62); the highest possible
>host address would then be 192.168.0.254, but this could be then interpreted
>as being in the ...240 network (...240|14). Defining subnets with different

Sorry I dn't follow you here.

The 192.168.0.240/29 network has the following possible addresses:

192.168.0.240
192.168.0.241
192.168.0.242
192.168.0.243 (Brodcast address)

>subnet mask lengths on the same host could be tricky, there is a RFC proposing
>a scheme for this (RFC1219). On the other hand, if you can't have 62 hosts
>on a /26-length subnet, then you don't have a /26 but longer subnet mask.

>There may also be a problem in that apparently some protocols (e.g. RIP- route
>information protocol) and some TCP/IP implementations do not (or did not?)
>permit having different-length subnet masks on a host. Another problem may

STinG does not seem ta have any problems whatsoever with my present
setup as long as I don't use the EtherNEC. There is no need for any
broadcasts on the nullmodem networks and I do not use RIP. I have saved
your proposal and may try a different addressing scheme when I get the
time (these things takes a loong time to setup...)

The only strange thing is that I can reach all subnets from both my pc's
but when TT3 uses the EtherNEC on the same network as the pc's I can only
Ping the pc's, the Internet and the other Ethernet Atari. When I try to
Ping into the subnets all I get in return are dropped Ethernet packets.

I guess I should setup a simplified addressing scheme to isolate where
the problems lies and go from there. It will soon be Christmas holydays...

Shouldn't do as the host is only 50pin, if the host was 68pin and the drive
50 pin then youd need a high byte terminator.

Not to burst your bubble, but your Amiga was designed by the very same team

Hi Stephen,
It's all new to me so all the info you gave is great! In my net
travels looking for charts I see comments referring to 16 colors as being
"safe" and the rest as "no guarantee". I assume because different
operating systems acknowledge the safe ones (more or less).
Thanks for the info,
John G.

3943. Re: Lyndon/Redelberger EtherNEC revisit

Newsgroup: comp.sys.atari.st

Message-ID: <IQTJ9.3411$TC4.12206@news-server.bigpond.net.au>
Source record: 30551

Just a quick note, re

>The 192.168.0.240/29 network has the following possible addresses:

>192.168.0.240
>192.168.0.241
>192.168.0.242
>192.168.0.243 (Brodcast address)

The correct number of possible Host addresses actually are

192.168.0.240 (Network Address)
192.168.0.241 1st usable
192.168.0.242 2nd usable
192.168.0.243 3rd usable
192.168.0.244 4th usable
192.168.0.245 5th usable
192.168.0.246 6th usable
192.168.0.247 (Broadcast Address)

The subnet mask is 255.255.255.248

With 29 bits borrowed it allows for 6 usable hosts per sub (3 bits in host field). It is also the last usable subnet, as the 192.168.0.248 subnet is Broadcast (probably already new that tho;-). I have cust competed the Cisco Netacad, and sitting the CCNA next week, so thanks for the practice, guy's. Hope this helps.

Mark

If LindowsOS has all the needed libraries (it should have it) ARAnyM should
work without problems.

3949. SM 125 circuit manual

Newsgroup: comp.sys.atari.st
Date: 2002-12-12 17:31:48 UTC
From: Mike <mikeborsley@fyldecoast.com>
Message-ID: <atah3sjdm1@newsg1.svr.pol.co.uk>
Source record: 30557

My monitor suddenly gave up. Looking inside there does'nt seem anything obviously suffering, in fact I was amazed at how new looking the PCB and components looked.

I've done a search for a circuit diagram without success. Found an SM 124 but was suprised to find it was quite different. If anyone has one they would share, or could point me to a site where one coulda be downloaded, I would be very grateful.

Thanks
Mike

>get it from the adaptor or some other SCSI device on your chain, then it can be
>added...grab 5v from somewhere (your power supply or from the joystick port,
>etc..) and add it to pin 26 of the SCSI bus.

This would work, but didn't the Supra drive include an internal
power supply for its host adaptor card? If not, or using an
external Link or similar device instead, I suggest that a diode is
used from +5V to pin 26 to make sure no reverse current flows if
another device also supplies termpower to the bus. He may not have
a second device at present, but perhaps wants to add a CD-Rom in
the future...

I have an idea at the back of my mind that some Supra devices used
their own driver software for their built-in host adaptor. Don't
know how compatible this was, and whether it can be replaced by
AHDI or preferably HDDRIVER easily or not.

Regards, /Peter/

3951. XaAES V0.962

Newsgroup: comp.sys.atari.st
Date: 2002-12-12 21:15:32 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <3DF8FB3F.C7E3FD23@chello.nl>
Source record: 30560

LS

There is a new version available on my homepage (in sig)

Done:

1
Removed the restrictions on shell_write(4, ...) (shut_down)
XaAES's shutdown is already restricted by nature.

2
Fixed a bug in file selector when clicking a '.' entry.
The bug caused XaAES to crash miserably. :-(

3
Improved the behaviour of the '.' as well, making it consistent.

4
Removed wind_calc from the NO_SEMA catagory; it allocates memory from the server
base.

5
Small fix in swap_menu.
The bug caused wrong setting of focus in rare situations.

6
Problems using the new Teradesk(2.0x)
The console device was lost by XaAES irregularly after booting up.
Inserted flag O_DENYRW in Fopen(u:\dev\console)
This seems to help.
I still havnt found what Teradesk does wrong.
In the very early history of XaAES I experienced that wrong GEMDOS calls
were able to mess the console reading.

3952. Teradesk V2.01

Newsgroup: comp.sys.atari.st
Date: 2002-12-12 21:15:54 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <3DF8FB5D.BC7FDF63@chello.nl>
Source record: 30561

LS

There is a new version available on my homepage (in sig)

Done:

- Scrolling editable text fields for very very long names.
Increased maximum name length in directory windows to 128

- Correct calculation of window width for TOS
- Correction of background colour in TC
- Not all AES's return sensible appl_getinfo(1&2) font info. (Milan)
Use the VDI in such cases.

- Accessories are started as it should.
New prgtype *.ACC in the dialogues.

- In file XFILESYS.C
Replaced ALL gemdos(...) calls by real function names which are
prototyped, so correct parameter coercions will automatically
be performed.
A wrong GEMDOS call can have implications on the MiNT gemdos as a whole
resulting in loosing the console device under XaAES.
(I experienced similar problems in early history of XaAES).

Hoping that this will repair the keuboard input problems.
Well, it didnt.

Then I changed XaAES's Fopen(u:\dev\console,O_RDONLY)
to Fopen(u:\dev\console,O_RDONLY|O_DENYRW)
It looks like this helps.

- DESKTOS.PRG is a single TOS only version, which will be kept alive
all the time.

3957. ST Football Manager - I wrote the original, anyone like to discuss?

Newsgroup: comp.sys.atari.st
Date: 2002-12-13 06:26:46 UTC
From: kevin@kevintoms.com
Message-ID: <3df97d68.641638837@news.paradise.net.nz>
Source record: 30567

I was wondering if ST owners would like to comment-

Most people know I wrote the original Football Manager. I have never written to this newsgroup before, but I am writing a modernised version of the game, and I'd like to make contact with players of the original game that I wrote all those years ago. I would love to hear from any players.

The screens blank, with no sign of the filament glow at the tube neck. The front LED is lit, so mains power is OK. I've not tried any voltage checks yet, as I'd feel happier following a circuit diagram. I gather the power supply is switch mode rather than transformer.
Do you know the pin no's for the CRT heater connections, and others?
Thanks for your interest.

3961. WTB (Australia): Atari 1040STE monitor cable OR information

Newsgroup: comp.sys.atari.st
Date: 2002-12-13 10:09:36 UTC
From: Mark <dangermouse_1974@NOSPAM.yahoo.com.au>
Message-ID: <AliK9.8373$TC4.28693@news-server.bigpond.net.au>
Source record: 30588

Hi...

Anyone in Australia have a cable for the Atari ST 1040STE ? If so and you will sell, please email me (remove NOSPAM).

Failing that, can anyone offer me some advice on connecting my ST to a Philips CM8833-II monitor (RGB and DB9 input). I just bought an ST thinking it would connect like my Amiga 1200 / 500 / 600 does but bugger....it doesn't. The 13pin DIN is a little different to the Amiga connector.

Can anyone offer advice on what I need and, if in Australia, where to get a 13pin DIN plug ?

Thanks

Mark

From: sonik@whsmithnet.co.uk
Message-ID: <3df9ce0b_3@news1.vip.uk.com>
Source record: 30572

Hi folks

I used to play both Premier Manager and its sequel to death on my STE so was a bit put out when Gremlin gave up the platform and didn't release PM3 on it.

Does anyone know where I can get Premier Manager 3 for PC? I'd love to play this game but as it's been out for years and years now, I doubt if it's still commercially available. Is it available as shareware or does any have a copy they'd be happy to sell?

Cheers
Al

>>I scan the nï¿½gatives with the orange tint, then take a graphic programm
>>like Chagall, then lower the red and green tints tint. Sometimes you can
>>just add blue.
>
>I usually use Photoline (I had never heard of Chagall until recently).
>The CLUT and histogram stuff doesn't make a lot of sense to me. Is there
>any info about how to use these features. The manual is pretty basic.

Load the RGB_INV.CU3 file into the clut editor from Photoline to convert the scans from the negatives back to their original colour. Next thing, apply the NEUTRAL.CU3 filter, that filter will restore the brightness/contrast level to daylight colour temperature, scanners usally overcompensate these values. Both filters are located in the CLUT/EFFECTS folder....

Cheers from Belgium
Dennis

This may be very elementary information for you, but just
in case...

It might be worthwhile to look at the underside of the PCB
to find "dry" or cracked solder joints, particularly in the
area of the flyback or other extremely hot areas. Another
area to check is where wires or connectors go from the PCB
to the CRT. Resolding these problematic areas has done the
trick more than once for me.

The only other information I can offer is that, depending on
the style and date of production, your monitor was probably
manufactured by JVC or Goldstar.

Good luck!

Randy Kwak

The Atari Times is proud to announce the release of the 2002 Year End
Issue! The issue is complete and even costs less than last years issue!
There aren't many copies left, so you'd better order one soon before
they are all gone!

The 2002 Issue Features:

* 104 pages!
* Dozens of Atari-only articles
* Interviews
* Jaguar, Lynx, 2600, 5200, 7800, Atari ST, & Arcade reviews
* An awesome color cover
* Plus the following articles, never before published!
- Progression of Atari Controllers
- The Atari Mascots
- 101 Uses for E.T.
- New 5200 reviews
- Warlords 2600 review and theories
- BMX Airmaster 2600 review
- 2600 Airworld story
- Greg Omi Interview (Lynx Electrocop & Klax)
- Why create new games or even classic remakes for dead systems?

Price: $15 plus $4 for US Shipping. Get one today by visiting

Where can I find it ?

> Fixes the double extender bug in the original GFA-Basic Compiler
> (GFA_BCOM.PRG). Will also fix a compiler previously patched with GFA-Basic
> Patch v1.07e (GFA_PCOM.PRG).

And where can I find that one ?

I don't know if it has anything to do with it, but I'm having trouble
compiling with GfaBasic 3.6 under MiNT 1.16a, but it works fine with
MiNT 1.15.12. I'm using GfaBaisc 3.6 with ErgoPro and Bastard.

No, I have very little time at the moment. But I did post a followup a
few days ago. With an error in it as well that another guy corrected. I
will however sort this out, possibly during the holydays...

OK, Roger, if Mario does not have his own copy available still, I presume
it is all right to repost it here. It will take me some time to retype it,
but I'm happy to do this for the record.

Charles.

Hello Carey,

I do not see why it should not work, but like others are saying,
you may have to change some jumper settings.

You're welcome Ed.

Still haven't got a good monitor for my Hades as of yet. Thought my mother's old Mac monitor would work, but it needs repair as does the Sony I was using. Both make it rather unpleasant to work with.

Been watching this discussion for awhile.

I discovered over the years that each Atari model took slightly different approaches from the user when pressing the alternate key to get the dang things to bypass the hard disk driver and boot from the floppy.

I just kept trying different timings of when I pressed the key, and also whether I pressed and released, pressed and held the key down, and kept repeatedly pressing the key, as well as when I started the process. Eventually, I found the one that worked. :-)

JemGing can't play Stereo/16/44, but any mono/8/22 will be played
with no problem :-)
On the other hand, if you want absolutely to play CD-like sound
within CAB, Didier Mï¿½quignon's Aniplayer does it very well. Just
declare it as a plug-in in CAB. Works great on both my Falcon and
my TT :-)

Not sure what you mean by "plug-in".
As an external program, Aniplay works great. I tried it also in place of Genjing as the sound source but I don't see how it will work without CAB sending the sound file externally. I was hoping to get CAB to play a sound while viewing an HTML file.

Hi John,

Aniplayer is compatible with the GEMJING command line, so Aniplayer can
replace GEMJING. The options supported are inside the documentation.
It's enough for CAB calls.

Regards,

Didier.

A\>Shouldn't do as the host is only 50pin, if the host was 68pin and the
A\>drive 50 pin then youd need a high byte terminator.

That's not true, I used an adapter without internal termination of the upper byte with a IBM DCHS-04U (-34550) and when the jumper for internal termination of the drive was off, it did not work. The jumper had to be off, because it was not the last drive in the chain. Then I bought another adapter with 'active upper byte termination' and now it works. The unused byte has to be terminated, when not used, that means with a narrow bus.

Johann

Hi Didier,
What I'm asking is if CAB could use Gemjing while viewing an HTML web page and sound heard (if there is a sound file in the HTML code. No problem getting Aniplay to work by CAB but not simultaneosly! Maby I should have mentioned I'm running single TOS (4.04) so now I'm thinking it will only allow one program to be active at a time! I'll look at Aniplay's docs anyway. Thanks for the input.

Obviously it does work, if you say so; I just remarked what the comments
in ROUTE.TAB said- and I suppose that defining a gateway in this case would
be more politically correct and maybe reduce the amount of assuming this
and that.

>>>Command on PC1, PC2 and NAT-box:
>>>route add 192.168.0.192 MASK 255.255.255.192 192.168.0.129

>I'm not aware of this switch. I used the documentation in "Windows 95
>Resource Kit" where this switch is not described.
>
>I simply let Windows execute the command by putting it in the Autostart
>folder. Works well.

Oh, I think that in Win95 this switch does not exist- i.e. when you type
route add ... etc... in the MS-DOS prompt window, the route always becomes
permanent. But in Win NT4 and (iirc) Win 2000 there is the "permanent"
switch. Btw. no need to put any of this in autostart- once defined, it stays.

>>>192.168.0.240 255.255.255.248 Ser.2/LAN 0.0.0.0
>>>192.168.0.192 255.255.255.192 Modem 2 0.0.0.0

>
>As ROUTE.TAB is read from top and downwards this should not be a problem?
>Anyway it does work well.

Hmm, I am not sure what should be the correct (by the rules) behaviour of the
router in this case- i.e. should routing depend on the sequence of route
definitions, or it just happens to be so in Sting? I used some tcp/ip software
(tcp/ip v5.0 on OpenVMS) which always sorted the defined routes so that
lower numerical values came first, 0.0.0.0 route coming always to the top, etc.
I think that Windows also rearranges somewhat the order of defined routes.

>>nodes on the ...192 subnet (...192|1 to 192|62); the highest possible

>With 29 bits borrowed it allows for 6 usable hosts per sub (3 bits in host
>field).

Anyway, in a case when routes are -NOT- considered sequentially, a node
with address, say, 192.168.0.244 could easily be recognized as belonging
to the 192.168.0.192/26 network (244 being 192+52, i.e. within the range)

Btw. I am not convinced of the desirability of setting a subnet identification
equal to the last part of the subnet mask (i.e. 192 here). Can perhaps Mark,
being curently into those matters, comment on this?

>The only strange thing is that I can reach all subnets from both my pc's
>but when TT3 uses the EtherNEC on the same network as the pc's I can only
>Ping the pc's, the Internet and the other Ethernet Atari. When I try to
>Ping into the subnets all I get in return are dropped Ethernet packets.

I faintly remember that pinging is somewhat sensitive to parameters
like time-to-live, etc; isn't it? Can it be, perhaps, that some value
is not optimally configured on that TT?

>- Scrolling editable text fields for very very long names.
>Increased maximum name length in directory windows to 128

Out of curiosity, how practical is catering for soooo long names? E.g. at work I use a computer system which enables long filenames, and yet rarely make names longer than about 10-15 characters, and file-types rarely longer than about 6-8 characters. Very long names are boring to type and make directory listings almost unreadable- and in Teradesk, they result in very wide dialogs- for example, file-type-selecors in Teradesk are wide enough to hold most *complete* file names- and result in some dialogs being wider than low-res screen (not that I use low-res much, but it should work correctly anyway).

Btw: re: file-type-selectors: in Teradesk there are several instances of them; sometimes they are "left-handed", sometimes "right-handed", and sometimes reduced to a single line; maybe that should be made consistent, so that all file-type-selectors have the same appearance (I would suggest that add-delete-change buttons be placed below the scrolling area, in order to reduce width); it would be just a few manipulations within the RSC file...

I noticed that layout of some dialogs has been slighlty changed; they look better now!- and also almost :) fully-visible in low-res- except for a couple of very large ones (in fact, if the two boxes in the "Options" dialog were placed one above another, it -could- fit into low-res...).

>- Correct calculation of window width for TOS

I am curious, what was the reasoning for the decision to make "fuller" change the window size only vertically- at first it was a very unexpected and slightly annoying behaviour for me- more so because this action actually makes the window slightly *narrower* than before (by rounding the width). If it is not desirable that a directory window covers the complete screen, maybe it could be made to make the window wide just enough so that all file fields (name ... ...attributes) are visible? (well, I can do that for myself, for a "personalized" flavour of Teradesk...)

Best regards;

3999. Re: new gfa compiler patch for newfatfs users

Newsgroup: comp.sys.atari.st
Date: 2002-12-15 00:55:26 UTC
From: lp <gfa@basic.net>
Message-ID: <BA213D2E.B0E3%gfa@basic.net>
Source record: 30459

Hi,

It's at my site:
http://www.q1.net/~atari/html/gfabasic.htm

All this patch does is solve the strange extender problem that has
been in the compiler since day one. It always adds ".gfa" to a file
name even if passed test.gfa, it ends up looking for test.gfa.gfa
which of course under long file names cannot be found.

Ironically single tos clips the extra extender off and so it
appears to be ok there.

Kernal 1.15.12 has newfatfs off by default, the mint.cnf is used to
set the status of the drives.

Under 1.16.x newfatfs is the default for all drives and the mint.cnf
tag newfatfs= is ignored. That was the problem here which this patch
solved.

Problem is the patch I made only fixes the English compiler. If yours is
not English you can send me the compiler and I will add support for your
language in the patcher.

I completely agree with you. However, most of the crazy long names come from
the wild world outside where names are used to present browsers (people) with
a abridgement of the content of the file.
It is all very unintelligent. I have worked many years on a OS that gave 2 names
to a file. A short one of maximum 11 characters which must provide uniqueness
within its locale and a long one that only served as information provider.

In fact it is very easy to implement such an approach in existing file systems.
There is no need to have a long name in the file index. That index only needs to
ensure enough characters for uniqueness.
The first block of the file can be used to give the long name and
any additional information. Such names become part of the data.
On modern fast discs with lots of cache it would hardly make a difference.

It is very easy to change the appearance of the dialogues, as long as you do not
change index numbers and object types.

It is only for text mode windows.
The reason is that Teradesk doesnt (yet) implement multiple columns.
So I didnt have any desire to look at large areas of useless white, covering
more usefull surface.

The fuller action will be improved. I just didnt want to spent a lot of time on it
to find out everything about the internals of the mechanism.

4001. Re: Atari Christmas/Holidays Sale!

Newsgroup: comp.sys.atari.st
Date: 2002-12-15 02:26:12 UTC
From: Paul Gifford <giffy1@comcast.net>
Message-ID: <tROdnUp91dGEdWagXTWcqg@comcast.com>
Source record: 30461
Cross-posted to: alt.atari-jaguar.discussion,comp.sys.atari.8bit,comp.sys.atari.st,or.forsale,pdx.forsale,rec.games.video.atari

Does it have to be in his message? What I find offensive is on his site.
He denigrates me (as a sometime Atari refurbisher and auction seller) and
others in these groups to increase his business. What if his site said,
"Don't buy from black people, buy from me, I'm white" but it didn't say that
in his message? Would you think it was trolling if someone wrote, "Hey,
don't go there, look what's on his site".

I don't call him names, I don't complain to his ISP, I'm not the jackass
posting anonymously. I'm just pointing out what I find offensive and
offering a link to a seller that doesn't knock one part of the already small
Atari community for personal gain. If that "anti-auction" page wasn't there
I wouldn't care a bit about his posts.

Trolling implies posting in such a way as to invite responses. The only
response I was inviting was an answer to my question from BS. There was
nothing inflammatory about my posting.

As for posts to st, it's true you won't find anything from me there except
for these followups. I'm an 8-bit guy...

I disagree. Maybe I'm some kind of exception but filenames like "Roger Zelazny - Amber 02 - Guns of Avalon - chapter 01.html" are very often guests on my harddisk. In most cases I make them shorter, but they are like this at least at the beginig at I need a way to shorten its name. I need a desktop that cn handle such filenames.

This is tricky one. Mostley because I came in half way through the thread. Seems to be IP's every where. TTL(time to live), does have a timeout period. If the delay is to great then it just discards the packet. I could probably help if you sent me a logical ip description. It seems just reading that you are trying to comunicate between different subnet's. This requires a default gateway, of course.If the IP's are ona completely different subnet structure(mask), the router will need to know on each port in and out. It actually look's pretty messy from what I have seen. But as I said, I only have half the story;-).

First time I came across file names that were too long for THiNG and the previous Teradesk releases was when I started installing SpareMiNT rpm packages. Some of these packages have filenames that are just a little too long.

I have both a German and an English version of GfaBasic 3.6 :-)
And yes, I got both legally.
I will try your patch on the English version. But I'll be happy to send
you the German version, to enable you to support that version also with
your patch.

Hi,

This must go before Christmas to clear space, whether the bin or to a
good home (prefer the latter).

Superbase Personnal Relation Database system - Manual and disk
1st Word Plus - Manual, only a copy of the original disk V2.02
Harlekin 2 - Box, Manual, Disk
Data Manager Professional - 2 Disks only
Prodata - Box, Manual and all disks
Fleet Street Publisher (Micrsoft!) Box, Manuals and disks

I'm in the UK, the postage cost is all I need and wouldn't be much.
Be quick if you want them.

Thanks, Lyndon Amsdon

4015. Stumped with HDDriver :-(

Newsgroup: comp.sys.atari.st
Date: 2002-12-15 15:19:48 UTC
From: Ken Springer <wordworks@greeleynet.com>
Message-ID: <1104_1039965588@news.frii.com>
Source record: 30476

I figure Uwe Siemet will read this eventually. :-)

TT030, 42mf RAM
HDDriver 7.54

Believe it or not, the TT still has the original ST157 hard drive installed in the internal bay. But it puts up a fuss now and again, so I decided to replace it.

I went looking in a local surplus parts store, and found a SCSI drive that had been removed from an Apple computer, presumably a Mac. Made by IBM for Apple, it is a DSAS 3720, 730mb formatted. According to IBM's website, this is a SCSI 2 FAST unit, which I did not know when I bought it for a whopping $15.

Right up front, I will say I've never had complete faith in 7.54, I could never get it to work on my Hades. But I also believe my Hades has a problem, always has. It's an early version.

Attached to my TT is an external ACSI 2 bay unit, I've forgotten who made the host adapter in it.

When the IBM drive is in the ACSI unit, no problem. The drive formatted fine, partitioned fine, I can see it just fine, I can read and write to it. I even instally HDDRIVER.SYS to the first partition.

But mount it in the internal bay??? Nothing. I've tried everything I can think of, the TT will not see it. I've terminated it, and no termination. I've removed the TT's internal SCSI termination resistor packs. I've tried HDDRIVER 6.22, no luck.

Is the problem the fact it is a SCSI 2 unit? Is it 7.54? Is it both?

I'm not out any money, since I can always leave it in the external unit where it works fine, apparently.

I don't mind upgrading to the latest HDDriver if that's the problem.

I'm sure open to suggestions as I need to replace the old ST157N before it fails completely.

The problem is - apparently - that you are trying to *boot* from this
drive. SCSI2 drives usually expect the command initiator to have an SCSI
ID, yet the TT has none. The only means to work around this is writing
yourself a new ROM file and patch it with TosPatch 3.06

<http://www.stud.uni-hamburg.de/users/in5y280/tospatch.html>

Well, actually I do not know whether thereï¿½s a TosPatch for the English
version of TOS 3.06, but the patches (or at least *the* patch) themselves
can be applied manually. Afterwards, split TOS into burnable ROM files and
then burn them onto EPROMs. You will get CRC errors if you only apply this
single patch and donï¿½t remove the CRC checksum subroutine, but the TT will
boot OK from your HDD.

> I don't mind upgrading to the latest HDDriver if that's the problem.

You could boot from the disk drive and let HDDriver set the TTï¿½s ID (it
is capable of doing so), but IMHO that would be a *real* pain in the ass.

Hi Ken,

KS>I've removed the TT's internal SCSI termination resistor packs.
No, you must not do so. The TT *must* be terminated. If there are external drives, the last one is to be terminated too. If there's non, terminate the internal (your problem) drive.

KS>Is the problem the fact it is a SCSI 2 unit?
I don't think so.

KS>Is it 7.54?
Neither that one. I'm pretty sure Uwe never released an unsure version.

KS>I'm not out any money, since I can always leave it in the external
KS>unit where it works fine, apparently.
In any case, you may boot from an external drive! Just tell HDDRUTIL to do so!

KS>I don't mind upgrading to the latest HDDriver if that's the problem.
Good idea, but not necessary.

What's about TermPwr? ID collision? Termination?

Right now, I'm running 3 IBMs (DCAS, 4.3, 2.1, 2.1 GB), the big one in the internal bay with no problems. All three had been running in PCs before.

Good luck to you!

Und TTschï¿½

I sure don't know what kind of a PITA this would be, not sure how to do it. But it's either this, or searching out a different SCSI drive at the store. Not an impossible job, but a true time consuming one! LOL

> I will try your patch on the English version.

I have tried the patch, but it doesn't solve the problems I'm having.
Apparently they are of another nature.

My current situation stays the same: When I want to work with
GfaBasic 3.6 / ErgoPro / Bastard, I have to use MiNT 1.15.12. With 1.16a
compiling doesn't work. With 1.15.12 I have set NEWFATFS for all drives
except my floppy drive A. For some reason I can't read floppies properly
with my CT2b in Turbomode and NEWFATFS set. Without NEWFATFS it's still
not very reliable but a little better. With MiNT 1.16a I'm having much
trouble reading floppies. I think it's a Falcon/CT2b problem really.

I'm not having long filenames on the partition I'm using GfaBasic on.
No VFAT enabled. Just NEWFATFS. I guess I don't need your patch in that
case? Or even worse: Under MiNT 1.15.12, when I patch my compiler with
your patcher, I can't compile - without your patch I can !?

Yes, it is a bit messy setup and because of the nullmodem connections
several subnets are in use.

I repost the complete setup below what I wrote before. Followups at the
top of original message certainly add to the mess...

Note that when TT3 uses the nullmodem alternative the "conflicting" ip
ranges appear. This does not seem to disturb anything as all computers
can talk freely to each other wih this setup.

But when TT3 is setup to use EtherNEC it can't reach any ports on any
subnet using STinG. With MagicNet however it does work.

>permanent. But in Win NT4 and (iirc) Win 2000 there is the "permanent"
>switch. Btw. no need to put any of this in autostart- once defined, it stays.

Just double checked and without the autostart add route trick the pc
can't Ping my subnets after reboot. I have not found any other way of
adding this route permanent so I'll stick to this far from elegant way.
Win 95 4.00.950 B with lots of MS patches/servicepacks added.

>Anyway, in a case when routes are -NOT- considered sequentially, a node
>with address, say, 192.168.0.244 could easily be recognized as belonging
>to the 192.168.0.192/26 network (244 being 192+52, i.e. within the range)

But note that this "conflict" only appears when TT3 uses nullmodem and
this is the working setup. When I take away this subnet and let TT3 use
Ethernet the problem to reach the subnets appears.

>I faintly remember that pinging is somewhat sensitive to parameters
>like time-to-live, etc; isn't it? Can it be, perhaps, that some value
>is not optimally configured on that TT?

Default TTL is 128 on all Ataris and they all have full Internet all the
time so TTL is not the problem.

I really should discuss this with Ronald Andersson who is responsible for
the STinG development. We share the same language and I've got his phone
number...

I actually think STinG (or the EtherNEC driver) can't handle the
situation with more than one Atari using Ethernet on the same network
properly.

at nospam@zonnet.nl wrote on 12/15/02 2:42 PM:

> I have tried the patch, but it doesn't solve the problems I'm having.
> Apparently they are of another nature.

Ok, can you give me more detailed report about exact nature of failure?
The patch I made only solves 'source not found' problem.

Some background. First with kernal 1.15.12 and NEWFATFS=I gfa always
happily work, as I only use drive I: for cd-rom images. All my gfa source
is on dive F:. This arrangement worked great with gfa.

Then one day I installed kernal 1.16.x and the compiler always failed
with source not found error msg. After some time I traced this the problem
to NEWFATFS. I compiled a special kernal with NEWFATFS off by default
like the previous offical release, then my gfa compiler works again.

The patch I made is not actually required if one can compile a special
kernal to suit your needs. However, the patch is suppose to allow the
compiler to work from a drive with NEWFATFS enabled. I guess I should
recheck the patcher to be sure it actually works. I fixed my copy of the
compiler by hand and then made the patcher binary.

4036. Mouse adapters (was: [CT60] Site updated)

Newsgroup: comp.sys.atari.st
Date: 2002-12-15 22:11:01 UTC
From: Michael and Nicole Freeman <nameerf@flash.net>
Message-ID: <BA224C69.285B6%nameerf@flash.net>
Source record: 30396

Hi!

After looking at Didier's site (looks nice, by the way!) some of the info about Eiffel interested me, and I had a question or two, for anyone who wished to respond. But first...

I've recased my Falcon into a mid-tower PC case in order to handle a PC power supply without having wires hanging all over my desk (after my Falcon PSU died miserably). So now that I'm in a recasing mode, I'd like to put in some kind of PC mouse adapter. I really don't mind the Atari mouse like some do, but recently my 16-month-old son got ahold of it while I wasn't looking and bashed it against the desk a few times. Needless to say, it didn't fair too well. It works, but not 100% reliably.

Now I've got a few options:

1. I could get an Atari/Amiga-compatible replacement mouse, but they're getting rare, are more difficult to get, there isn't a big variety to choose from any more, and are more expensive than most decent PC mice.

2. I could get a PC mouse adapter (like the one by Mario Becroft made that the mouse plugs into one end of, and it plugs into the Atari mouse port). The problem with that is that it isn't exactly an attractive device, and with my current, crowded, desk configuration it would hang off the side of the desk (from my MegaSTE keyboard) and likely get damaged.

3. I could get a PC keyboard and mouse adaper (like Eiffel or the other device from Mario Becroft). But I have a MegaSTE keyboard wired in, which I really like alot (even more than most PC and Mac keyboards I've used). And I don't like the idea of having PC-keys that aren't labeled with what they really do. Maybe I'm just weird (no comments, please... ;)), but I like being able to look at the keyboard and actually see where the Undo and Help keys and such are, and not have extra keys that are really useless, and labeled for PC specific things.

That said, is there any way to get a PC mouse adapter that can be wired internally to the Falcon motherboard, yet still be able to use the MegaSTE keyboard, including the joystick ports on either side (for joysticks instead of the mouse)? Or, are there any other options I've not heard of?

Thanks a ton!

Note that the Hades is not supported officially anyway, because its
hardware is known to be not fully Atari-compatible.

> Is the problem the fact it is a SCSI 2 unit? Is it 7.54? Is it both?

No, SCSI-2 and SCSI-3 work fine, as other users will confirm.

> I don't mind upgrading to the latest HDDriver if that's the problem.

Have you already tried the current demo version? Any SCSI drive should
work, if not up to now it has always been a problem of cables or
termination.

I cannot find you in my database of registered users, by the way. Can
you please send me your HDDRIVER's serial number?

I don't have the SCSI specification available right now, but if you have
it you can just look the meaning up. The sense codes are exactly those
listed in the SCSI-2 or SCSI-3 standard.
Tools like DISKUS (German only though) display not only the codes but
also a textual description, by the way.

There is no chance because in the past any company that was initially
interested in translating the software and the manual was a bit shocked
by the amount of work. It would also have been a maintenance problem
because for each update the texts in the GUI would have to be translated
again.
And unfortunately there is yet another reason: There are hardly any
users left who are willing to pay for commercial software for the Atari.
The number of users who are using commercial software illegally, without
paying for it, is growing. I can tell this very well when looking at the
Internet newsgroups and regularly seeing postings from users using my
software without being registered...

I got my first version of HDDriver with the Hades, and then the incompatibilities started becoming apparent. I gave up on 7.54 and went back to 6.22 which never gave me any problems. And 7.54 worked fine on my TT.

I didn't know there was a current demo available. I'll download it from your website and try it.

Please check your email. One of the "dard" sides of the Atari marketplace has always been its reputation for piracy. I'm proud to say I'm not part of that. :-)

A little off the subject, but piracy of commercial software seems to be the norm everywhere any more. I can't believe the number of people I know who regularly copy programs and pass them around. Sadly, Atari users have the reputation for being the worst, but I believe the DOS world are the champions of this.

Check the newsgroups for fonts if you want to see public requests for postings of commercial fonts, even from college newspapers who ought to know better!

I did some more test and I think I found my problem: I didn't have any problem :-) It looks like ErgoPro! is aware of the .gfa.gfa extender bug. If I use your patch the bug is corrected twice and instead of a double extender, what remains is no extender at all! If I try to compile a file like TEST.GFA, ErgoPro! complains: "Cannot open TEST".

Now, with an unpatched compiler, and a normal MiNT 1.16a, using NEWFATFS, I can compile again.

The moments my compilations under MiNT 1.16 failed even before your patch was available were caused by Libcom I think. With the standard library no problems. I've never seen much improvement with "improved" patched GFA libraries like Libcom and Gfapatch 1.07 anyway. In many cases I'm getting better results with the original GFAbasic 3.6 versions.

I have the oppsite problem, apps coded with the original libs cause problems
and unexplained lockups, mostly under mint on my hades. If I recompile
these old source with gfa-patch 1.07 the problems go away. But, if you get
the results you want then that's good. I'm glad you got it working under
the new kernal. GFA is still loads of fun after all these years.

Before you go replacing bits get the machine checked. The drive is dumb, it only does what the ST tells it and if it's getting no instructions it won't do anything. I have both shape drive in stock.

One of the nice things about ErgoPro! is that I can easily switch between
different setups with different patched or unpatched compiler, linker, and
library versions. For each project I can choose the combination that works
best. But most of my problems are probably caused by my own nasty Basic
coding :-)

Yes it's true, but you can use page up and page down for repalce shift
up/down.

There are another solution, use a serial/PS2 mouse on the RS422/LAN
port. It was my solution before eiffel.

> That said, is there any way to get a PC mouse adapter that can be wired
> internally to the Falcon motherboard, yet still be able to use the MegaSTE

Eiffel use the serial keyboard port so the original keyboard is
deconnected with the 2 DB9 used for joysticks/mouse.

Regards,

Didier.

Today my CT60 need an update. I have this card since November 5, today I use my configuration under MagiC 6 excepted SCC (HSMODEM/STing,etc..) & DSP. SDRAM isn't valid but nevertheless it's a nice configuration lot of faster than my CT2B removed.
Rodolphe has fixed problems like blitter, dsp, sdram since this time.
I cannot use SDRAM today, so I finish the TOS patches in flash begun by Xavier Joubert (the 1st developper, busy today.. no free time before Christmas) :
- XBIOS DSP functions with handshake are normmaly finished.
- CT60 XBIOS is finished (parameters and temperature reading) => used by the CPX.
- SDRAM configuration is finished (capacity read on his EEPROM).
- PMMU tree is normally finished (I cannot test it with SDRAM acces problems).
- TOS can be transfered at the top of the SDRAM (an option inside the CPX).
- Emulation of FPU & integers (like movep) unimplemented instructions works.
- System font and atari logo are moved at the top of the ST-RAM because the blitter use direct acces to ROM and the flash contains always a TOS 404.

It's possible than I receive my update just before or after Christmas, so it's possible than first peoples receive their CT60 before New Year.

It's a great works during this end of 2002, thanks to Rodolphe !

Regards,

Didier.

Hello Atari users,

Here are some new versions of my tests programs (153 Kb):
http://membres.lycos.fr/pmandin/download/cleancode-0.13.zip

The archive contains the latest version of:
- the PCIBIOS test program (I hope it *REALLY* works now).
- the audio XBIOS test program (with Falcon ext. clock detection).
- the video XBIOS test program (with NOVA support).

If you have a Falcon with an external clock, could you test and report
the audio test. Thanks.

Sources are available (121 Kb):

What XBIOS function numbers do you use? Just to avoid collisions, the Milan
uses XBIOS 160-162.

It is an interesting concept (which OS would that be?) Is that "first block"
visible to the user as a real part of the file or is it sort of "hidden"
by the OS for the housekeeping purposes (I suppose that otherwise it might
be slightly problematical to exchange files with raw data -samples, etc.-
between diffeent OSes?). Btw. many times I have groaned over the limitations
of the MS-DOS/FAT system, because at work I mostly use OpenVMS which
implements quite comprehensive "file attributes", "file access blocks"
and "record access blocks" containing a lot of useful information about
file organization and status (I think that it would amount to about
a hundred information-items per file).

I know, I have played with it a little- and luckily, because you wisely
provided references to all index numbers by item names, even the structure
can be changed (within limits) if one recompiles everything after that...
the purpose of my remark was to suggest that maybe a change in the appearance
of the file-type-selector can be made in the "official" version in order to
make it more suitable for low-res.

Hmmm, thinking now of the logical organization... it looks as if the
"View" menu generally controls the *visual appearance* of items shown on
the screen, and "File mask" controls *what* is shown, perhaps the logical
place for "Show hidden files" and "Show system files" would in fact be
in the "File mask" dialog, not in the menu... just thinking...

Best regards;

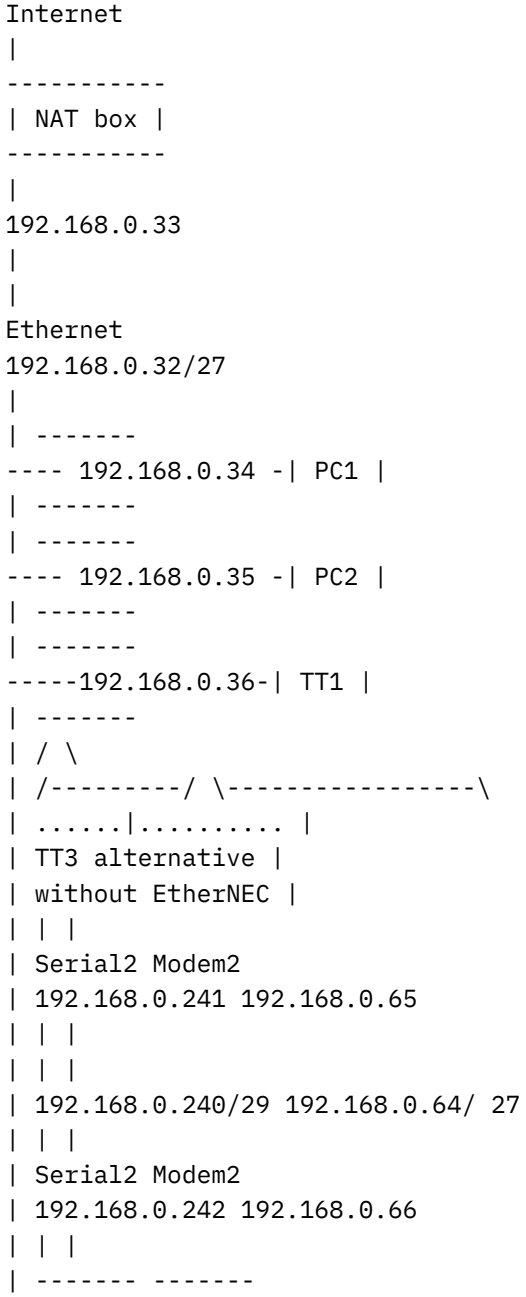
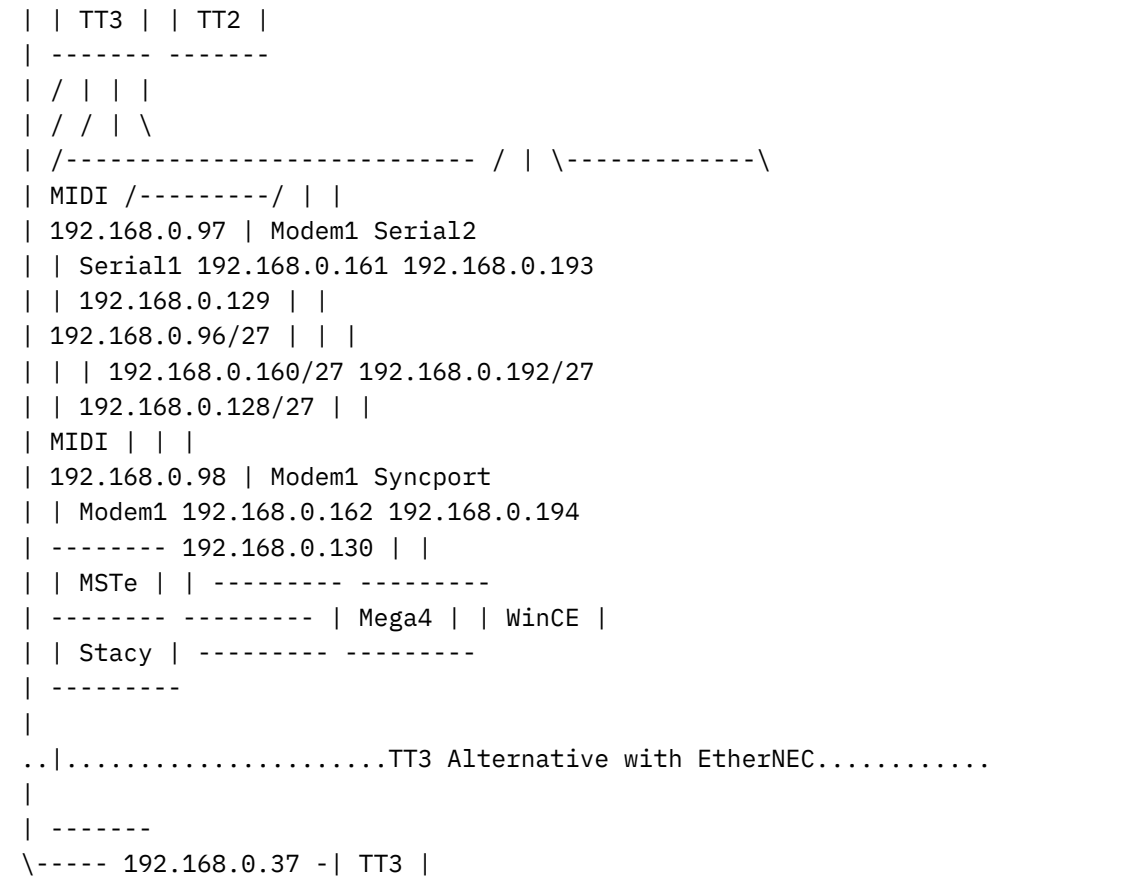
Sorry to take so long. It is pretty messy all right. You need to subnet the main network, using 192.168.0.xxx the 255.255.255.0 mask will stop ANY traffic from getting out of the Ethernet network. This would be because it considers all traffic in this range (subnetted or otherwise) to be local traffic. If it isn't visible then it will discard the packet. Try making it simple by just borrowing say 4 bits.





Using 3 bits mask for the whole lan is 255.255.255.224

Every Subnet needs to be added to the NAT box using the route add command.
As well as all the other route paths. The gateway will be the next IP up the
food chain i.e. for the Mega4 it will be 192.168.0.64 255.255.255.224
192.168.0.161.

See how you go. It would be a hell of alot easier to do it, any chance for a
plane ticket?LOL

There is a disgruntled customer out there making lude comments about the owner of Bravo Sierra Computers, Ben Smith. The person who is doing this to Ben began doing it using his regular log-in name. Then, after Ben complained, the person continued to do this under an anonymous log-in. Also, he was setting up his news posts to make it look like Ben had participated in some of the writings. He did not. Ben Smith is an honest, fair businessman who is being unfairly treated in the newsgroups comp.sys.atari.8bit and comp.sys.atari.st. I have bought software and a book from Ben, for my Atari 800XL, and I plan to purchase Microsoft B.A.S.I.C. and a power transformer for my second 1050 disk drive from him after New Years' Day, 2003. The 1050 Drive was purchased on e-bay from another vendor. Take my word for it - I am working on my Associate of Science Degree as a computer programmer, and have enjoyed computers since I was 13 years old. I am now 33 years old. Here is what I wrote Ben, after recieving my latest order:

Dear Ben,
>
>
> Thank you, my friend. With DOS 2.5+ and the 1050 Disk Drive
> manual, I was able to boot my Atari 800XL into DOS 2.5+, make a back-up

The main problem for the Atari platform is that illegal copies can
hardly be tolerated anymore. As long as there are many users illegal
copies are annoying but not really a big problem because there are still
enough paying users who ensure that a commercial product can survive.
But as soon as the number of (paying) users is shrinking and those using
illegal copies continue to do so it's lethal for a platform.

Definitely not. A second PCI BIOS that is installed on top of the one on the
TOS can not know about how the hardware was initialized by the bootblock -
this can only fail!

And there should be really no need to do so: if there is a bug in the
built-in PCI BIOS, send me a bug report.

From: voojspam@xs4all.nl
Message-ID: <5ea83221.0212170904.37de9dc4@posting.google.com>
Source record: 30439

Hi all,

I have a load of ST disk images, but only a few 3.5" DD disks. That's a bit of a problem.

Would it be possible to store disk images on an IDE drive and connect it to the ST, and load the games from there? I imagine they'd have to be converted somehow.

Another way would be to use 3.5" HD disks, but I doubt if that would work...

Hope this can be worked out.

Greets,
Marc

>If the adsl modem isn't also a swticher...I don't understand what the fuss is
>about DHCP.

The ADSL modem is a DHCP server and the manual says that the computer
must be set-up to receive an IP address from the modem, i.e be a DHCP
client. This information wasn't known to me when I bought the modem but
it probably wouldn't have meant much.

>Then, if your modem can do this alone (without the
>help of windows or somesuch drivers) you need to configure it with your account

I need to be certain that the router has PPPoA. BT ADSL is PPPoA and this is
supported by the modem I have. The router must also have PPPoA otherwise the
connection will not work. Most GB cable companies use PPPoE and there are
far more routers that support this (older) protocol. I may need to get a
combined router/modem for BT ADSL.

How bout extracting them into folders, then putting the ST onto a network
with PC, and loading from that?

Hi, I find that if you cover the non-adjustable hole on a HD disk you can
format it to work on an STFM. it also works on a Win 95 PC so you can use it
to transfer files between the 2 computers. Cheers, Nigel.

Hmm!

The problem with HD (high density) disks isnt down to the hole that is
used for HD detection, but from the media itself.

The heads on a standard DD drive can corrupt the data around the track
being written AND on the other side of the disk, due to the thinner
media used.

Of all the ST's i have, not fitted with a HD drive, not one will
reliably allow me save and record the data. However of the many external
drives i have tried, only one i have will read and write to one.

If you want to use HD disks on your ST, I would suggest using the
modification that allows you to use a HD drive as a DD drive, then you
should be able to use the disks with the hole covered. I cant remember
off hand the address for the mod.

Hi

The ultimate ripper may not work on emu's as it doesnt work on TOS's
above 1.62.

I did take the time, many moons ago, to go through every bit of code,
byte-by-byte (I must have really been sad at the time). It took around 3
months and something like 15,000 line of assembler later had converted
it into asm code.

Then came the fun, it actually worked when i reassembled it!! I dont
think the cartridge obeyed the rules for entry points to ROM routines
(in otherwords clean code). It's predecessor 'Multi-Face ST' from
Romantic Robot had a similar failure, as that wouldnt work on STE's.

There is a piece of software that is like a TOS version, runable from
desktop 'Probe 2' i think.

It could be a small step towards a more sophisticated system.
Set a unused attribute bit if such blocks are in use.
Keep everything in those blocks in displayable form, so the representation is
independant of any OS.

I think MAC OS has something like that. I cant remember exactly how it is called.
(resource fork?)

The main thing is that you disentangle and disconnect file placement mechanisms
from file administration systems.

The OS I was refering to is ICL 2900 series VME. (Virtual Machine Environment)
First released in 1972. It was written in Algol68, the CLI was a subset of that language
It implemented a very comprehensive Codasyl data base for managing everything.

Such as users, privacies, filestructures, files, volumes, hardware, you name it.
There was no difference between CLI objects and any other executable object.

ICL was a Brittish computer manufacturer.

well guy! you are in the wrong newsgroup. this is only for 16-bit
computers like the atari st or tt was. Atari 8-bit (this is where
Zebuland etc. was running on) is topic of comp.sys.atari.8bit.

For Ke-Soft, Kemal Ezcan is out of business for several years and has
no web adress. But he is still an atari enthusiast as far as I know.
But his Games like Zebuland or The Brundles are still very enjoyable
to play.

the drive is internal somewhat dirty. I triet to clean it a little bit
This allows me to run simple files form disk, but with more intensive
disk access (games), there are still read/write failures.

This idea have several design flaws. First, storing the long name in a
data block is very unintelligent as the data blocks are normally much
bigger as the filename and so you have lot of unused space (especially as
data blocks are normally at least 1k or bigger).

Second, assigning the name directly to the file is a bad idea too. The
file itself have nothing todo with it's name. The name is only the visible
representation of a specific file in the filesystem. That's why unix
filesystems difference between the file itself (inode) and the name of the
file. So a directory just contain the filenames and the file reference to
the file metadata. How the directory is organized is another thing, there
are several concepts to minimze the required space or increasing the
search time (btrees for example). That's why you can also have several
names for the same file (hard links) that is a very nice feature.

Tschuess
...Frank

Hi

The title rings a bell. It's possible that it's still available
commercially, I think I saw it at my local Co-op supermarket in the
budget section, 4.99 GBP, so should be available from other retailers!

So have you checked the Atari? Will it format a disk, save the desktop and
reboot?

Have you checked the disks on another ST?

It's not impossible that your drive is useless but having lost hundreds of
pounds in floppy drive sales just by fixing the machine that would be my
first test.

If your drive is stuffed and you don't want to cut the case then use an
external drive and switch the drive select line.

> be converted somehow.

I have been thinking of such a solution for a while, with the idea to develop a board interface to be normally plugged into the floppy connector of the ST, letting him think he is driving a floppy. But in reality the interface would go to a PC, via USB or EPP or even the serial interface (115 kbauds). Indeed, the transfer rate does not need to be higher than 250Kb/s.

On the PC side, a simple software to serve image disks would have to be written. Although some people might hate to have to run a PC beside their beloved ST, who lives without PC nowadays ?

This solution would also be useful to Amstrad CPC users

I might come one day with a hardware solution, it is a nice project!

4105. Question about ews uploads on the Belgian ftp-server

Newsgroup: comp.sys.atari.st
Date: 2002-12-18 18:41:55 UTC
From: donotusethisaddress@pandora.be.invalid
Message-ID: <1fneip2.9uo594vdow44N%donotusethisaddress@pandora.be.invalid>
Source record: 30315

Hello,

I just noticed someone uploaded to be Begian ftp-server (chapelie) two archives:
javascript_src_mod.zip
Hisoft_Basic_Sources_Jones_p.zip
The first one seems to hold the javascript 1.4.2 release for Atari platform from John Rojewski.
I don't have an idea what the second archive is about. It's old stuff coming from Paul Jones.

Anyone knows more about these archives?
Are these archives free to use? We (Karl and I) really don't want to put illegal archives on the server.

Note for future uploaders:
We really would appreciate it if every upload you made would be accompanied with a short text file explaining the meaning of it. This will make the maintaining of the server easier.

TIA
Martin, one of the maintainers of the Belgian ftp-server.

4106. 68060 CPU deal for CT60, Milan

Newsgroup: comp.sys.atari.st
Date: 2002-12-18 19:02:33 UTC
From: Vernal Elm <sales@nospam.vernalelm.com>
Message-ID: <k42dnZs2Oq9xWJ2jXTWcqQ@comcast.com>
Source record: 30316

I thought some of those who are monitoring this newsgroup for CPU deals would be interested to know that Vernal Elm LLC (http://www.vernalelm.com) is offering a deal on Motorola 68060 50MHz processors that is good through December 31, 2002. They are only $85 each.

The CPUs are full versions (MMU/FPU), so they're the right kind for Atari accelerators like the CT60 from Czuba Tech, the Milan, etc. They also come with a 30-day unconditional warranty, so you can return them for any reason within a month.

Check out the website or e-mail sales@nospam.vernalelm.com (remove the nospam.after the @ sign before sending message). Thanks for reading -- accept my apologies if this message was a nuisance.

Source record: 30317

On Tue 17-12-2002 01:32 (GMT) Mark Bedingfield wrote:

>Sorry to take so long. It is pretty messy all right. You need to subnet the

Well, apart from the alternative with a 192.168.0.192/26 and
192.168.0.240/29 to TT1 on 192.168.0.0/24 I can't find anything messy at
all. That setup did work perfectly so obviosly not too messy for STinG to
handle...

The other alternative with two Atari Ethernet computers is very logical
imho.

>main network, using 192.168.0.xxx the 255.255.255.0 mask will stop ANY
>traffic from getting out of the Ethernet network. This would be because it
>considers all traffic in this range (subnetted or otherwise) to be local
>traffic. If it isn't visible then it will discard the packet. Try making it
>simple by just borrowing say 4 bits.

You must have missunderstood something very fundamental here!

In my book there is nothing strange with a setup with networks like:

192.168.0.0/24
[router]
192.168.0.192/26
[router]
192.168.0.200/29 192.168.0.208/29 192.168.0.216/29 192.168.0.224/29

which equals my setup.

>Every Subnet needs to be added to the NAT box using the route add command.

All computers (NAT-box incl.) on the main 192.168.0.0/24 network must
know the gateway to the only(!) subnet at this level like:

route add 192.168.0.192 MASK 255.255.255.192 192.168.0.129

The hierarchical setup with subnets in two levels makes this possible.

>See how you go. It would be a hell of alot easier to do it, any chance for a
>plane ticket?LOL

I have not yet done any practical tests to nail down why pc's and NAT-box
all can reach the subnets, but an Atari (TT3) using EtherNEC can't. They
are all on the same main Ethernet network.

Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

Hello Atari users,

Here are some new versions of my tests programs:
http://membres.lycos.fr/pmandin/en/perso.html#Cleancode

The archive contains the latest version of:
- the PCIBIOS test program (more info given, full names for devices)
- the audio XBIOS test program.
- the video XBIOS test program (Milan MVDI modified).

If you have a Falcon or clone with an external clock, the test may
crash the program (as it is still in the works). If you have a Milan
with MVDI, the current mode info should be nearly available. Please
test. Thanks.

Due to the way Lycos now handle downloads, I can not give direct URLs to
files anymore.

Note that in *some* cases an accessory named DIMFILE might help. It directly
loads .ST images into a sort of ram-disk. It appears to be quite reliable-
I have it on my Mega all the time. It was coded by an atarian from Croatia
and can be found on the 'net (on "croatian atari page" or something like that).

Quoting from DIMFILE documentation:

---vvv quote vvv---

This accessory can load disc image file into memory and declair it as drive
specified in name DIMFILE?.ACC. If drive already installed, taking over
if DIM-file is loaded. If not loaded, drive works as before. If error occured
when trying to take drive, declair it as B:
If founded XBRA: RamA, use this Ram-disc instead of memory.

Just open accessory in menu bar and in fileselector choose file.
You can open: - MSA files (packed and unpacked)
- DIM files in E-Copy format
- DIM files in Fastcopy format
- ST files (same as E-Copy DIM files)

When loaded, menu looks like: M:\ 12345678.DIM
(means that boot sector is executable)

- Accessory can handle 12 bit FATs (normal floppy disc FAT) and 16 bit FATs

- If disc is singlesided and image file is saved as doublesided,
program can reorganize memory like it saved as singlesided disc.
If image saved as "only used clusters", program can reorganize clusters,
but if number of ocupied clusters not equal to number of loaded clusters,
sorting will not reorganize disc.

- If you want to load another image file, select accesory again in menu bar.

- If you want to clear occupied memory, select accesory and input empty name
(no matter in which directory) and click OK.

- Drive M working as regular RAM-disc, you can even write to it.

- If you holding [Alternate] while selecting menu, dialog box appears.
You can change disc BPB.
With pressing: [Alternate] = +/- 1000
[Control] = +/- 100
[Left Shift] = +/- 10

If you change number of sectors to higher value, it doesn't make ramdisc
bigger, but you can make it smaller.
If you click on top box "MSA-DIM RAM Disc", you can save image of ramdisc.

- If you holding [Alternate] while selecting:
- [Force 2] , changing to [Force 1]
- [FAT1->FAT2] , changing to [FAT2->FAT1]

Vuk & Co.&#65533;

>ICL was a Brittish computer manufacturer.

Oh, I remember ICL; back in the 'seventies/eighties, while I was studying at
the university here, we had an ICL computer. I don't recall the model, just
remember that it pretty much filled a large room and had a line-printer
the size of a small car. At that time I was not much interested in operating
systems, but that computer gave me my first practice in FORTRAN, and also
a first contact to a Calcomp's set of scientific graphic subroutines for
pen plotters, AKA the "Plots" or "Plot" package. (I used that Calcomp library
for a long time, when I started working we used the same pack on Vax/VMS but
adapted for another device. Later still, I adapted and improved the routines
to make them independent of the actual output hardware, and finally I adapted
and recompiled them one more time and now they run happily on my MegaST with
Prospero FORTRAN, and output via gdos/nvdi...).

If you do get it fixed post and let us know. I still think a modern
replacement is a much better bet.

Barrie at Keychange.

You need a TOS that supports colour icons.
TOS >= 4 or MagiC

or MiNT + XaAES/NAes

Remember that colour icons take a lot of memory.

There must be a place on the net somewhere that has the specifications for different SCSI drives.

In particular, I'm looking for the jumper settings on a Digital DSP3210 SCSI drive. I can find them for sale all over the place, but can I find the jumper settings? Not on your life.

Any suggestions, anyone?

Thanks.

Ken

4121. Avalon On Falcon?

Newsgroup: comp.sys.atari.st
Date: 2002-12-20 05:17:58 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <eFxM9.8412$C06.5694@news.bellsouth.net>
Source record: 30331

Has anyone succeeded in getting Avalon to run on a Falcon?
If so, how?

Needless to say, this works just fine on my Mega 4 connected to MMA_SDS devices.

I have version 1.1, of course with the dongle.
What is the latest version?

Any time I attempt to launch Avalon 1.1 on the Falcon I get the message:
"Can not load mros*.*"

I've tried ST High mode...with and without CT2b turbo enabled.

I did try swapping out the mros to the 3_45 version with CAF (and of course the CT2b patched version of 3_45 as well), and every other version I've been able to get my hands on...none working in any Falcon mode.

Also, I grabbed an archive from the steinberg ftp site called avalon21.zip.
This package does not run on EITHER of my machines. A garbled screen is tossed up and it says, "Can not load img file".

Any info appreciated...
Brian

Why are you subscribed to an Atari / Video game ng when 99.9% of the
machines that these groups cater for would be by your standards
considered DEAD.

Many retailers for such a small market means there isn't much business to go
around. That's just reality.

> >Maybe you should get a real job instead... or go into selling PC stuff
with
> >Atari items as a sideline?
> >

When he's begging for business I can only assume that he isn't real busy and
I don't consider selling a few bits and pieces online real work. I've done
that for a couple of years and didn't call it a job, because I did it in my
spare time after coming home from my real job.

Where the hell can you buy a new Atari? Atari's computer division has been
dead for years and market share has shrunk to virtually nothing.

I'm curious to know why it is a concern of so many people what Ben does
with his time or how he earns a living? Is he hurting your family
financially or physically? Is he forcing you to buy Atari stuff?

Why not just leave the guy alone? If you don't like the way he does
business, just don't buy from him. It's as simple as that.

So because you didn't make any cash out it enough to call it 'a job'
then you have the right to suggest someone 'get a real job'. The
definition of a job is that which through work provides the income to
survive, I think Ben and the other retailers feel that they have valid
'jobs'.

Ben's promotions are often coming from a different slant, no they are
not to everyones taste but at the end of the day ALL ADVERTS are
Begging for business.

Which does not answer the question, if anything it makes the original
question more obvious.

Why are you in a group / community that you feel is both dead and
people are wasting their time in...Surely it's also a waste of your
time being in here if you feel it such a dead donkey.

Sorry, I just don't understand the knocking of ANY retailer in such a specialist market, if you just don't like the mans adverts then say so but don't spite the mans efforts to make a living.

That doesn't necessarily mean dead. Severely depleted, sure. On the brink, ok. But not quite dead yet.

>> He runs a business..I think that's a real job....And you?
>
> When he's begging for business I can only assume that he isn't real busy and

Perhaps he has other sources of income that are inflexible and not filling his financial requirements and is trying to boost it through his Atari sales, or is not in a position to able to do any other kind of work (which from his previous posts is in some ways true). Yeah, he might expand business by selling PC stuff, too. In fact, a lot of PC things can be used on newer Atari's (hard drives, monitors, CD-ROM/R/RW drives, etc.). That's his choice. But telling someone to get a "real job" without knowing their situation is just plain stupid and rude. It's like telling someone on welfare, "Get a life," when you don't know what circumstances have put the person where they are.

>> Why are you subscribed to an Atari / Video game ng when 99.9% of the

Try getting a Milan or Hades. Wait until the new Coldfire Atari clone comes out. Upgrade your existing Atari (if you have one) with a graphics card or CPU replacement (like the soon to be released CT60). Just because an originating company has disappeared doesn't mean the platform itself is dead.

I know I'm very late on this, but I had one extra thought.
Do you use a boot manager like XBoot or Superboot? If so, it may be
that your NEWDESK.INF file is being overwritten from somewhere else...

I'd always thought that drives were set up differently for the Apple
compared to the ST/PC.

> Is the problem the fact it is a SCSI 2 unit? Is it 7.54? Is it both?

SCSI 2 is no problem per se. Neither is HDD7.54 - I've been using it
since v3.02! It's bound to be a setup thang.

> I'm not out any money, since I can always leave it in the external
> unit where it works fine, apparently.
>
> I'm sure open to suggestions as I need to replace the old ST157N
> before it fails completely.

Have you set the drive as the boot drive in HDD when you've tried it
internally? Have you set up for the correct SCSI drive to have access
and to be the boot drive when you switch from external ACSI to
internal SCSI. Basically, go through the HDD manual from scratch, even
if you think you've got everything right.

If worst comes to the worst, you could have your existing external as
the internal drive, the new one as the external and configure HDD to
boot from the external!

I do the doc files for Highwire. If you have any questions you can
ask me and I will try to help you.

Hi,

Does anyone knows a proggy that can copy the files from TOS floppies (created on a Mega ST2) to a PC. When i open such a floppy, teh PC asks me to format the floppy and i want to copy the songs i created early 90's to my PC with VST on. I know, this might be not the best place to tell i want to use my PC instead of my Mega ST.

Can someone please help me here. I tried Gemulator 2000 (only sees empty floppies) and the Gemxplor (this will take ages to copy file by file. The only solution i see is to copy every floppy to the Megafile and then copy to a dos formatted disk, but this will take a while.

Thanks for the help,

Greetings,

Jacques

Clockmeister,
I would have to agree with Mike Freeman on his comment that when the XTOS computer comes out that anyone that may have considered getting a new Atari compatible computer will probably get one. They are talking about using the Version 5 Coldfire chip that can be clocked as high as 600 Mhz. and possibly higher with the right cooling system in it. Dont belittle the Atari market when the computer market as a whole SUCKS. Lets face it, even the PC market has shrank enormousely in the last 2 years. Nobody wants to go out and spend 1500 to 3000 dollars on a computer that will be obsolete in 1 year. I would not say that the Atari market has shrank to nothing. The WEB is bringing Atarians from all over the world together and if you really sat back and contacted many of these people they would tell you that there are more people just like them. I live in the USA, OHIO to be exact and I have several that I know that are close in proximity to me and we talk quite regularly about Atari related topics. I would have to say if the Atari market is so dead why do you TROLL in this newsgroup.

Grab this free GEMXPLOR utility (the first url is the page it can be found on, the second url is a direct link to the GEM Explorer utility). BTW, this utility can also look at an ST hard drive connected to your PC (usually requires a SCSI host on your PC).

http://www.emulators.com/download.htm
http://www.emulators.com/freefile/gemxplor.zip

Launch it on your PC...
Stick the ST made disk in your floppy drive...
Browse the floppy and drag the files you want to where-ever you want it on your PC.

That's the simple way ;)

Other method...
Is to format a DOUBLE DENSITY disk on your PC, then use the ST to move the files to this new disk.

Hope this helps...
Brian

4145. Help with XOR

Newsgroup: comp.sys.atari.st
Date: 2002-12-21 03:04:19 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <UNQM9.15414$C06.8625@news.bellsouth.net>
Source record: 30355

I have version 1.12
On my Mega 4, with TOS 1.4, when trying to grab banks from my peavey DPMV3 the program complains that data is deviant.

If I boot XOR up under MagiC 6.01 on the Mega...it works just fine. It also works fine on my Falcon.

Is there some TOS patch that I need to get rid of this problem?

Also, my EOR disk and archive has become corrupt and unuseable (gotta love it when water pipes freeze, bust, and leak when you're away), could someone possibly send a copy of the EOR archive from the profiles disk to me?

Thanks,
Brian

I'd not heard anything like that over the years. You would think that SCSI is SCSI.

> if you think you've got everything right.

Uwe was very nice in offering help and suggestions via email. (We are lucky to have someone like this still supporting this platform. Shame and a pox on those who steal his software!) He is quite sure it's cables and such. We never discussed the possibility of the TT slowly failing.

I've got everything hard drive related disconnected, and the TT simply does not see this drive when it is in the internal bay and I'm booting from the floppy. But, if I put it in the ACSI external box, it sees it fine, reads and writes to it. It doesn't seem to matter whether the TT's internal resistor packs are installed or not.

I took another SCSI drive out of an old PC box I have here, basically the same, but at least the drive is recognized during bootup. But that's as far as that drive goes. When the desktop finally comes up, it doesn't think the drive is there, so I can't install an icon for it.

Plug that old ST157N in and all is happy. So I'm going back to the junk store, write down what SCSI drives are there, then come back and check them out to see if any of them are plain SCSI.

>
> If worst comes to the worst, you could have your existing external as
> the internal drive, the new one as the external and configure HDD to
> boot from the external!

Good idea, but the drive in the external ACSI unit is an old 5.25 hard drive, won't fit in the bay. But it won't do me any good to figure out how to boot from the external drive if I can't get the TT to recognize the internal drive.

Ken

This particular one is too busy working and 'getting to know' his
new Linux box (Duron 1.1GHz, Mandrake 9.0) to check out c.s.a.a
all the time...

Good to know that Sinplop is still around to receive some ribbing!

How ya doin' Pete!!

I hope you flame me about Linux, but B4 you do just remember where
OS X comes from...hehe!

Kind regards,

Chris Wilkinson, Middle Earth, New Zealand.

PS. My Falcon030 is still in active duty, but due to complexity of
my POV-Ray stuff that sort of stuff has 'migrated' to my new beast.
Oh, and POV-Ray renders look nicer on a 1600x1200x24bit 19" monitor!

;^)

Hi,

Has anyone a Plexwriter CDwriter working with a
TT and using HDDriver 7.7? Somehow i can't get
the TT recognize the CDwriter and because i can
borrow the machine for the weekend from a compant
to look if it'll all work i want to know if these
will function. By the name Plexwriter i guess it
is a Plextor or am i wrong?

Could it be that i have to adjust some jumpers
inside and how does it work with the termination?

I hope that somebody can help me out...

Raoul Teulings

Ken,

I have had similar problems with my TT. I think there is something marginal about the SCSI system in the TT and about the way drives behave in it. In the end I went to a computer fair and bought up all the 1gig units I could find (bought 5 total coast was about the same as the 730 you got) and eventually found one that works in my TT.

They all work fine on a PC but only one works well on the TT....

Dave.

If you still have the Mega then it is the best place to make the copies.

1. Format a spare 720k disk on the PC.
2. Take that disk to the MEGA and then copy the files from your ST flopies
to the new disk.
3. Then the disk to the PC and copy across.

There is also a TOS tool (so it runs on the Mega) that will adjust the
formatting of a TOS disk to make it PC compatible, but I can't remember its
name.

Other solutions include PARCP http://joy.sophics.cz/parcp/ or a proper
network connection.

> Can someone please help me here. I tried Gemulator 2000 (only sees empty
> floppies)

You need to turn of DOS access to the floppies. I can't remember where it
sets that, but turn it off and it will work.

Years ago, Double Click Software wrote a little program that simply wrote the necessary DOS info to the correct sectors on the floppy. I don't remember if the disk had to be blank or not.

If you don't find a simple solution, email me. I should have a copy of it here as I've still got my DC Desktop package here somewhere.

Any kind of optical cd drive had nothing to do with an hard disk driver.
Your device isnï¿½t a hard disk :)

> the TT recognize the CDwriter and because i can

Switch of plexwriter id on hard disk driver and install ExtenDOS
or SPIN034

> inside and how does it work with the termination?

You device(s) should appear while machine boot as example:

IDE 00.00: TOSHIBA MK2110MAT G4.0 Direct Access
IDE 01.00: Direct Access
SCSI 01.00: QUANTUM MAVERICK 540S 0901 Direct Access
SCSI 02.00: QUANTUM LIGHTNING 730S 241E Direct Access
SCSI 03.00: QUANTUM FIREBALL1080S 1.09 Direct Access
SCSI 04.00: YAMAHA CRW8824S 1.00 CD-ROM/DVD
SCSI 05.00: IOMEGA ZIP 100 R.41 Direct Access
SCSI 06.00: TOSHIBA CD-ROM XM-5701TA3136 CD-ROM/DVD
SCSI 07.00: ATARI FALCON HDDRIVER 0780 Processor

You found optical devices on ID 4 and ID 6. SCSI ID 7 stands for falcons
on board SCSI controller. Looks like same as on TT. Replace "Falcon"
with "Atari TT" in mind. ID7 should not be used for other devices.

To access optical device(s) use ExtenDOS or SPIN!034.
Have a look to the following example with ExtenDOS:
(Best way to have access on cd rom drives AND cd writer)

MAGX-NeT dated Oct 3 2001
MagX-Net 1.3 PL 9, beta
(c)1998-2001 Vassilis Papathanassiou

Loading interfaces:

I just don't like the way he begs for business. If he is that hard up he
should expand into other markets to prop up the Atari side of his
business... It was just a suggestion, and a good one IMO.

And Atari is dead, the computer division that is, not the legacy hardware
which is obviously still being used or no-one would be here.

A business person would come to realize that his market isn't significant
enough to make a living from it anymore. I simply argue that the way to
resolve this problem is to diversify, and not beg.

Hi,

I have a PlexWriter in my Hades060. However you should refer to the manual
that goes to the unit you have for jumper settings. Not all units have the
same jumper options or located in the same place on the unit.
Also hd driver won't do much more than list the device at boot up, that's
it. That is if you turn on some option called "allow cd-rom devices" or
something similar. Anyway, you need additional drivers for cd-rom such as
extendos which works good with my plexwriter.

Another ST emulator, TosBox, has an option for using tos-formatted
floppy disks (TosBox would not see it as drive A or B, but as another
drive which has to be specially defined in the INI file). Within some
limits (i.e. if the floppy does not have some weird format such as
84 tracks x 11 sectors) this may work.

The grammatical construction of this reply suggests that this reply originated from some kind of string generator/random reply parser. I wonder is Sinclap isn't actually a lonely computer just trawling news groups spooling out its dribble, i suppose it could also be the work of the fabled infinite number of monkeys taking time of from the complete works of Shakespeare...

Ben is almost as brain damaged as Sinclap, maybe they share a similar head injury.

>blank or not.

There is also the PD 'DISKMOD.TOS', the ST to IBM Disk modifier,
used with 'BLOCK0.DAT' that contains the actual IBM-style boot
sector to be written. This can be used with existing Atari
pre-TOS 1.04 disks and does not affect any files on them. The
program dates back to 1986 and was written in Personal Pascal by
J D Eisenberg. It's under 7 kB for the executable plus 512 bytes for
BLOCK0.DAT.

If you can't find it on a PD site, tell me if you want it mailed.

Regards, /Peter/

Either my dongle doesn't work with this version, or it is corrupted.
I get the same behavior as the archive from the ftp.steinberg.com archive.
Upon launching, the startup screen is messy and it says, "Can not load img"

All thanks for the cooperation and help. I still
want to connect the Plexwriter to my TT. I get
the response during booting up that the device is
not responding. I've changed a lot (cables,
terminator, drivers etc.) but stil no connection.
It is a second hand writer and there's no manual
which means i can't see what jumper should be
changed to terminate the writer propoerly. Does
anyone has a same device connected to a TT and
can help me further?

Thanks in advance,

Raoul Teulings

Hello everybody,

Sorry for writing a private mail in the forum, but I have big trouble with
my emails accounts.
--------------------8<------------------
Dear John,

Since yesterday my ISP censored my last working account. Now I can read but no
more sending emails ("connection refused by server" when trying).

I also noted that each time an account was censored I complained via a valid
account and that one was censored few days later.
Now nothing left, but posting on forums.

I may use a friend adress, but please always reply to my usual adress.

All webmail servers I tryed (yahoo, mail.com, etc) are javascript based so can't
be used by my good Atari.

All ideas are welcome, especially if you know an HTML based webmail site.

Regards

I would think the manufacturer would have the manuals on-line as
pdf or such. Have you looked on their site for technical info?
Most places have online manuals these day.

Hi Harry, I had a load of sofware on it from when I bought it, I
decided to back it all up, then start fresh, but got problems doing
that. I've sorted it now though, got rid of the pain in the back side
error, and am using just the standard desktop now, eveytime I save the
desktop, it act like it should...
Thanks... Rob

Ok, finally back up and running fine. But I gave up on the IBM hard drive I mentioned in the original post and initially wanted to use.

First, I want to publicly thank Uwe Seimet for the help and information passed along in email. The information is printed and stuck in my TT owner's manual.

Second, after the holiday shopping rush is over, I'm going to upgrade my HDDriver to 8.1 via Atari Workshop so I can have an English manual. I want to see if it works any better than 7.54 on my Hades. I never got this version working, so I use 6.22 there. Yes, I'm aware the Hades is not officially supported, but I'm curious to see if it makes a difference.

Third, someone posted that there was nothing wrong with version 7.54, and that may well be true via operation. But, for me in TT high resolution, none of the buttons display in any of the dialogs. Makes for an interesting time figuring out where to click. I solved the problem by putting a 7.54 floppy in my Mega, looking at that screen, and clicking the area on the TT. :-) Hopefully, the new version will fix this. Also, on the Hades, the text does not fit inside the buttons correctly in the screen resolution I use.

A complete review and solution follows for those who are interested.

Uwe gave me some good suggestions on what the problem might be via email. I tried them all, none of them worked. Then, Saturday morning, some encrusted brain cells shook off the rust, and I remembered I used to have a bigger hard drive in the internal bay and it worked fine. But I had moved it to the Hades and reinstalled the ST157N. So, I took that drive out of the Hades and put it in the TT. And to my surprise, it did NOT work either! As you may guess, that didn't make me feel very happy.

As it turns out, both drives are IBM Deskstar SCSI-2 Fast drives, but different sizes. The one that used to work in the TT is a 3540 548 mb drive. The one I bought for $15 is a 3720 730 mb drive. So I thought I would just add the 3720 to the Hades. And guess what! It doesn't want to work there either. There are some jumpers on the 3540 that I did NOT put on the 3720 for this test, but will try that before giving up on the drive totally. After all the 3720 did work when it was mounted in my external ACSI unit. If I can't get it to work in the Hades, I'm not sure what I will do with it. Uwe said some TT's don't like Fast drives connected to the ACSI port and corrupted data may result.

This is where I gave up on the hard disk.

Since the smaller IBM drive no longer works in the TT when it once did, I've come to the conclusion that A) something is getting old in the TT and I'm pushing it too far, or B) something in the TT is just fine, but marginal in design and I've pushed it to the edge. It's just a curiosity thing now because everything seems to work. The only thing not tested is the SLM804, but I'm sure it will work too.

I went back to the surplus store, wrote down the numbers on the drives, researced them to find out what they were, and bought 3 SCSI 1 and one SCSI 2 (not FAST) drive. A Maxtor LXT213SY, SCSI 1, is in the internal bay and boots the TT just fine. A Maxtor 7345S, SCSI 1, has been added to the external ACSI unit. A Rodime reports it is write protected, and a Fujitsu seems to be flakey about deciding if it wants to even run. Both units have jumpers that control these functions, but I haven't figured out yet if I need to change other things also to get them to work. Projects left to do.

So, other than the battery, and needing to update all the icons, program file locations, etc, I think the TT system is back up where I want it to be. Just need to get it connected to the internet again. It hasn't been connected for about 4 years do to moving a couple of times.

4183. Supra Hard Drives

Newsgroup: comp.sys.atari.st
Date: 2002-12-22 16:53:35 UTC
From: Ken Springer <wordworks@greeleynet.com>
Message-ID: <1103_1040576015@news.frii.com>
Source record: 30391

Any here remember the old Supra FD-10, a 10 meg floppy drive Konica mechanism that used special 5.25 floppies? It would also read 1.2 meg IBM floppies.

Supra drives apparently allowed a standard SCSI drive to be plugged into their external units. Did anyone here ever accomplish that?

I had an FD-10 unit mounted in the external ACSI drive in the TT referred to in the Stumped... thread, but never was able to get it quite right. Similarly, I have the same problem in the Hades.

I've put the FD-10 back into its original shoebox case, and have connected it to my Mega where it works just fine.

Has anyone ever attached a SCSI drive to an external Supra drive? I'd like to connect a ZIP there and copy all my FD-10 disks to the zip. Some of the data on the FD-10 disks is deteriorating, and I'd like to save as much of it as I can.

I'm open to suggestions as to how to go about this. I don't find Supra's manual all that enlightening on this subject, but you have to realize there was no such thing as a Zip drive at that time. <G>

>can help me further?

I have same problem with a Ricoh MP6200 : so far, it made me lose
20 CDs. I tried almost everything : changing the cable, the order
of the devices within the chain, as well as the terminator... :-(
When connected to the TT, it is ignored at boot-up unless I switch
it on after the computer, which doesn't happen when connected to
the Falcon. But, in both cases, it will cause CDWS to abort after
the first track or before the last, depending on if I try to burn
on the fly or from a partition. More : although it is given for -
and reported as by the software - supporting pauses smaller than
2 seconds, it will always crash after the first track if I try to
use suc pauses, and although I once already succeeded to burn CDs
with such short pauses as 0.3 second!
As I'm beginning to be fed-up with wasting CDs, I just intend to
buy a Yamaha and throw the Ricoh straight into a wall, so I will
make it pay for all the CDs I lost so far because of it! :-(

J.-Luc

4187. New HD and Partitions

Newsgroup: comp.sys.atari.st
Date: 2002-12-22 22:02:26 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3e063672.0@entanet>
Source record: 30246

Hi all,

I am just in the process of fitting a new HD in my Milan.
What a palaver...

Change NV ram to include new IDE number, re-boot
Use HD-Driver util to include new IDE number in bus scan, re-boot
Play around with IDE leads and master/slave settings, re-boot
Un-plug CD drive to simplify things
Disable ExtenDOS
Repeat for an hour until able to partition the new HD
Reconnect CDs and restart ExtenDOS
Try to figure out why the new HD doesn't work now
Realise that ExtenDOS is stealing the IDE number of the HD
Run ExtenDOS Install to change IDE number of CD drives

After all that I thought I was on a winning streak. I partitioned
the new HD as follows:

H: 1 G-Byte TOS compatible if I ever decide to use it as a Boot drive
I,J,K: 5 G-Byte
L: 4 G-Byte

I have amended the MINT.CNF to include the I,J,K,L drives as NewFat
and VFat partitions.

The 1GB TOS partition works perfectly but the others return this error
from THING:

vital data illegal (recsiz=0, numcl=2147437203)
TOS-46

So I tried the Jinnee demo:

vital data illegal (recsiz=0, numcl=2147437203)
legal recsiz=0, numcl=2147437203)

These looks suspiciously like Mint errors (1.15.12) but the
Mint docs say:

" supports FAT32 partitions;
partitions larger than 2 GB are no longer a problem"

So I am a bit puzzled. I can think of two possibilities, either
HD-Driver 7.71 doesn't support >1GB partitions which I doubt or
there is a problem with the blocksizes or something like that.

All suggestions welcome.

Yes, I have one sitting in front of me as I type this, attached to the
ASCI port of my TT. It works happily with HD Driver, with the proviso
that it must have a disk in it at boot time or HD Driver doesn't
recognize it.

>Supra drives apparently allowed a standard SCSI drive to be plugged into their external
>units. Did anyone here ever accomplish that?

Yes. Before I acquired the TT, my main machine was an MSTe. The MSte
had its internat 50mb Seagate, the FD-10 and plugged into the FD-10,
a Syquest ezFlyer 220mb, which worked impeccably. However the
ASCI to SCSI converter in the Supra case is a limited one and would
not handle the Sony cd-drive that I tried to attach to it as well.
(but Link 97 did.)

>Has anyone ever attached a SCSI drive to an external Supra drive? I'd like to connect a
>ZIP there and copy all my FD-10 disks to the zip. Some of the data on the FD-10 disks is
>deteriorating, and I'd like to save as much of it as I can.

I don't have a Zip drive so I have no experience there, but the FD-10
has given me no trouble with an STF with the original Supra drivers or
on the STF, the MSTE or TT with HD Driver 6-8

Peter,
It is my understanding inside of HDDriver while in
the partition menu. Under TYPE you will need to tell
it F32 which of course means FAT32. Hope this helps.
If you need any further help please responde via my E-
mail. I will try and help you any way that I can.

Thanks,

4191. Best IDE for Falcon?

Newsgroup: comp.sys.atari.st
Date: 2002-12-23 01:24:06 UTC
From: swampfax1@atlantic.net
Message-ID: <WAtN9.11$RL.3382@news1.atlantic.net>
Source record: 30250

Hi All,
Sorry if this posted twice!

I can use some ideas on the best brand of IDE drive for a Falcon running with a 32/50 Phantom SE and booting with HDDriver. I usually only run TOS 4.04 (no multitasking) and I believe I can get 16, 1 gig partitions on an SCSI drive.

So, some things come to mind like:
Is it 16 for an IDE?
Is a new Seagate (or other) IDE faster than a 1996 Seagate SCSI?
Does the Falcon limit speed?
Can a Seagate IDE ATA 100/66/33 interface be used?
What type of cable is needed?

Advice appreciated!

John G.

I would think those would be of some use if anyone ever figured out the drivers for them for linux or another OS or their documentation was released. Last time I asked about somethign like that I vaguely remember a response like "Atari VME ports weren't full vme ports". Or something ;-)

There might be minor differences in the firmware, but as long as the
drives are compatible with SCSI they will work with any computer. I have
never heard of Apple drives not to work with other machines as well.

As long as other peripherals are recognised it is highly unlikely that
something is wrong with the TT in general.

Did you create partitions on this drive? If it is recognized during
bootup it should work fine. As long as there are no partitions there
won't be any icons.

The TT is equipped with standard SCSI hardware (NCR5380), which has also
been used in numerous other machines. There is nothing special with it.

> Your device isnï¿½t a hard disk :)

This does not mean that HDDRIVER should not find it when scanning the
bus. And in case a CD-ROM driver based on the SCSI Driver interface is
being used it is even required that HDDRIVEr recognizes the CD-ROM drive.

It's not HDDRIVER that must support these partitions but the rest of the OS, MiNT in this case. Partitions > 1GB must either be FAT32 or Ext2fs partitions under MiNT, and they have to be initialised accordingly. Current versions of HDDRUTIL support creating of FAT32 partitions. With older versions or in order to create an ext2 partition you have to use other tools.

> So, some things come to mind like:
> Is it 16 for an IDE?

The number of partitions is not related to the hard disk type. It's just
a matter of the operating system. With plain TOS 4.04 you can never
have more than 16 partitions.

> Is a new Seagate (or other) IDE faster than a 1996 Seagate SCSI?

This does not matter, as any drive is faster than the Falcon. In other
words it will always be the Falcon that limits speed.

> Can a Seagate IDE ATA 100/66/33 interface be used?

Yes.

> What type of cable is needed?

A standard IDE cable. No need to get special IDE DMA cables as the
Falcon does not support any kind of IDE DMA anyway.

No, I did nothing with it, no jumper changes or anything. I just wanted to see if the TT would know it was there. This is a working drive in the PC, it has Windows for Workgroups installed on it, and I didn't want to do anything to damage the data on the drive.

4202. Linux and ARAnyM

Newsgroup: comp.sys.atari.st
Date: 2002-12-23 12:40:45 UTC
From: Ken Springer <wordworks@greeleynet.com>
Message-ID: <1104_1040647245@news.frii.com>
Source record: 30261

Having read hear about ARAnyM, I've gotten interested in learning something about Linux.

Long ago, I learned that it was a command line OS like DOS, but some work was being done on a graphical user interface. I have no idea where this all stands when it comes to the Atari platform. Is there a website that covers this?

I've learned there are at least 2 "flavors" of Linux, GNU and Debian. ARAnyM uses Debian, but what is the real difference between the two versions? I've not found much help so far in reading he ARAnyM site, but have signed up for their email list. Not much traffic, and what has been there has been "over my head". <G>

I'm really not planning on installing Linux on any of my Atari's, I want a bit more speed I think. My thoughts right now is to do this on my PC or Power Mac, possibly both. There seems to be 3 major Linux versions, Lindows, Red Hat, and Mandrake. There may be more, I don't know. But Lindows is the only on that is Debian based. I had asked earlier here in the group a question of ARAnyM and Lindows compatibility.

::chuckling:: I have so many computers sitting here these days, I guess I could go "wild" and install a different one on each computer! In that case, I guess I could even put a copy on one of the Atari's! LOL

Any basic information you feel like passing along would be appreciated.

Ken

In the MINT.CNF I have the partitions set as follows:

NEWFATFS=F,G,I,J,K,L
VFAT=F,G,I,J,K,L

F & G are 500MB and are on my original HD.

I didn't format the new HD I just re-partitioned it. Later I
used HDRUTIL to change the I,J,K,L partitions to F32 but that
only changed the numcl size in the error message.

Do partitions > 1GB not work with HD-Driver ?

I suppose it is time I upgraded anyway ;-)

Merry Christmas,

Peter

Andreas is totally right. Better help developing EmuTOS, a free TOS
clone, instead of using downloads, which are illegal, if you did not
once by the corresponding computer.

http://emutos.sourceforge.net

Or buy a copy of MagiC, if you want something more up-to-date.

BTW, Andreas, is it possible to bye a copy of MagiC to run in (any)
emulators without bying the MagiC emulator for windows?

4211. HighWire 0.1.0 Released

Newsgroup: comp.sys.atari.st
Date: 2002-12-23 23:44:06 UTC
From: Dan A <artdept@coinboards.com>
Message-ID: <3e079c34$0$1452$6d5eecc5@news.eurekanet.com>
Source record: 30271

The HighWire Development Team would like to wish everyone in the Atari community a Merry Christmas and we hope you enjoy your present from us.

A year after the initial public release of the HighWire project, we are happy to inform you that version 0.1.0 is available for your download and enjoyment.

What's new in HighWire 0.1.0?

'Unofficial' online use. It's not finished and mainly for testing. But the adventurous can give it a try.

Source code has been modified to make it's use in other projects easier.

Complete Unicode support for TrueType fonts

A real history function per window, also available from menu bar (better than in NetScape 4.x)

Partial functionality of FORMs

Smaller memory foot print for documents in memory

New functionality for browsing the local file system (directory listing), sortable by name/date/size.

Meta tag for "refresh" implemented, even if the refresh time will always be taken as '0' yet (scheduler limitation).

A large number of rewrites removing an equally large number of bugs.

To download and more information, visit the HighWire website
http://highwire.atari-users.net

> it on after the computer, which doesn't happen when connected to

That must be a problem with the SCSI chain. Normaly any SCSI device
gave a message while the computer boot up. Something is wrong if not.
Thatï¿½s not a "can" thatï¿½s a must.

1. Parity should be off on all devices
(Switch it only to on if any device incl. contoller supports parity)

2. missig TermPwr, Termination wonï¿½t work correct
(Broken terminator)

3. double Termination, more as one device had swich on "term"

4. last but not least, double used SCSI ID

5. Simple the SCSI bis is too long. 2M max. on Narrow SCSI (SCSI2)
(Any peace of cable makes the bus, do not forget internal flat wire)

1 and 4 are most wanted mistakes i know :)

Only the physical last device on any bus must be closed by an
terminator. Any drive between controller and last device have to swich
"term" to off.

SCSI Bus in form of an "Y" wonï¿½t work correct if parts of are longer as
10cm.

Regards, Robert

There's a slight bug, are you sure that the GDPS module is actually working
but that the picture has been scanned into a very narrow window which you
then have to select and re-size in Calamus?

Cheers

>John G.

If you are talking about bidding, etc, then the answer for me is
yes. Sometimes after 2-3 bids Cab crashes, but a re-loading of the
Cab gets the whole thing working again.

Are you using Extendos Gold? If not, you should be. I would
contact Roger Burrows from Anodyne and ask him if the drive would
work with Extendos. He helped get my Sony CDRW drive working.
Great guy and great service....

Hi Ed,
Yes I'm referring to bidding and anything that needs to be logged in
for! With view source I see references to Javascript so I was assuming
that was the problem. I can view items for auction ok. Which OVL are you
using?

Here's a place that offers free popmail accounts that should work with any number of Atari popmail fetchers for STik/Sting/Mintnet/etc.

http://www.hotpop.com

You 'might' have to use a PC or Mac to log in there and set up your account(s), but once it's set up, no sweat grabbing and sending mail with your trusty atari machine(s).

Wow...I remember using that a bit on a 1040STfm with half a ZRAM upgrade and a SuperCharger DOS emulator back in 1991. Once I got PageStream I never looked back, as Ventura was a bit overkill for my needs (and quite slow compared to PageStream on the particular hardware I had) Those were the days...

Sounds interesting for a hardware hacker.

I'd guess that they might all work with appropriate drivers. The
chances of getting the info to write such a driver are probably small,
except for the memory cards, which should be tolerably
straightforward. Do you have any specs for these things?

>
> H: 1 G-Byte TOS compatible if I ever decide to use it as a Boot drive
> I,J,K: 5 G-Byte
> L: 4 G-Byte

If you want FAT32, are you sure you assigned the correct partition id
'F32'? If not the partition is not initialized by hddriver as FAT32 and
not functional at all.

> The 1GB TOS partition works perfectly but the others return this error
> from THING:
>
> vital data illegal (recsiz=0, numcl=2147437203)
> TOS-46

This looks like the FATFS driver access this not as FAT32 partition but as
FAT16. This don't work for sure.

Hi

Doing a little newsgroup catching up:)

There was Football manager 1 & 2 by addictive, iirc fm 1 also came out
on the ST.

I'm not a fan of management type games, but i do know they got rave
reviews.

Hi

Yup it's a pain in the rear. You have to find the bits in their online
support before you get an answer.

BUT, i have had some serious problems with them over the last few
months;) and have replied to an email address:) this address must be
available as they have no idea when i replied.

Try this addy:

Customer Support ukwebform@ebay.com

I originally selected 'My question is not listed' which should be the
subject line.

Dont forget to give them your ebay id, like i always do;)

Hi

I wonder if Maplins still do them? dont think it would cost a lot to
send a cable over to you, i know the plug would cost very little.

I have a supplier over here in the UK that does some Atari bits and
pieces, along with other machines, I am waiting for their catalogue. If
you drop me a line, as a reminder, I'll chase it up for you after the
holidays.

A few months back, someone posted a question in the newsgroup asking why only 24 messages maximum were ever displayed in his/her newsgroup reader. I have the same problem, but did discover you could go to Google and see all the messages that ever existed.

Did anyone ever find an answer to this problem? I have always assumed it was a problem somewhere with the newsgroup setup itself, but never followed up on it.

I'm at at a relative's home for the holidays, and am using their computer to check the newsgroup. At home, I've used 2 different browsers for this newsgroup, Netscape 6.2 and 7.0, and Opera 6. Both have the 24 limit problem. I do not have any version of Outlook installed, a means of avoiding those nasty viruses that the bad guys write for MS products.

My relatives only have Outlook Express 5 installed. They are not newsgroup followers, and use AT$T's Worldnet Service as their ISP, which does not require an email program.

4237. Re: Newsgroup message display

Newsgroup: comp.sys.atari.st
Date: 2002-12-25 16:56:38 UTC
From: John Hager <camarojohn@worldnet.att.net>
Message-ID: <arlO9.12516$p_6.1013733@bgtnsc04-news.ops.worldnet.att.net>
Source record: 30197

Outlook sure does things I'm not expecting, like sending an unfinished message when I exited the program. LOL

Anyway, OE5 is telling me I've downloaded 292 messages, and another 164 messages have not been downloaded. So something is really funky here. I haven't figured out how to get the remaining 164, but I'll keep checking this out.

If anyone has thoughts about this message display problem, send them along. When I get home, I -DON'T- want to have to use Outlook to view all the messages.

4244. Music notation program?

Newsgroup: comp.sys.atari.st
Date: 2002-12-26 18:52:03 UTC
From: Michael and Nicole Freeman <nameerf@flash.net>
Message-ID: <BA309E72.28DFC%nameerf@flash.net>
Source record: 30204

Hello!

I kind of have a feeling that this doesn't exists as I haven't found it anywhere, but I thought I'd ask just in case. Does anyone know of a music notation program that has the following features:

1. Works in any Atari OS, not just the built in TOS/GEM.
2. Works in a resolution other than ST Medium and ST High (i.e. is resolution-independent).
3. Uses GDOS/NVDI vector fonts and printers.
4. Is fairly comprehensive, like Cubase score.
5. Doesn't need to have MIDI compatibility, but that would be a plus.

I have Cubase Audio, which has Score built-in. I like using it, but it'd be nice to not have to keep switching OS's when I want to use it. It also doesn't use vector fonts and newer printers, so it won't print directly to my printer. I have to print it to a file, then load it into either a image viewer capable of printing, or into Papyrus (which is what I usually end up doing). Both mean that once again, I have to switch OS's to get it printed. It's extremely time consuming and frustrating. I also don't like the bitmap text fonts. I'd like to be able to use any font on my system, including vector fonts. And since my printer is very high-res, I'd like to be able to make use of that, by using vector fonts that aren't restricted to 360dpi.

Anyway, does anyone know of such a program? If not, any takers on programming one? :) I'm desparate for a really good notation program. Thanks!

Mike Freeman
nameerf@flash.net

P.S. to programmers: One of my pet-peeves is MIDI/Music/Notation software that is limitted to a single OS (i.e. TOS/GEM) and one or two screen resolutions. Is there a reason that this is done? I know people use ST's a lot more, but I would think that it wouldn't be too hard to make the program read what resolution it's running in and adjust itself. Maybe I'm wrong...

First let me assure you that I agree with you!
I'd love to see your wish list come true myself.
It's pretty unlikely thoe...
Here's some things that might help make your experiences at least a little smoother.

> 1. Works in any Atari OS, not just the built in TOS/GEM.

I realize you don't get long file names, are still limited to something like 16 HD partitions at once, etc. However...CuBase does work with Geneva, and it's a big help and much better than running it without! I've a CT2b in my Falcon, and CAF works just fine in all my favorite high color resolutions. The screen redraws a bit slower in true color, but still useable.

Lately, my favorite set-up for working with CuBase Audio Score is a monochrome 1180X720 resolution. I boot in CT turbo mode with HDDriver 7.93, NVDI, ExtenDOS Gold, Geneva, and STing. Thanks to STing, and some fairly beta, but useable drivers offered free by Roger at Anodyne, I'm networked with my old ST, Windows PC, and my broadband ADSL router using a Dynalink SCSI/Link T ethernet adaptor. I don't get color here, but I do have a nice large display to work with, and I open CAB browser, a telnet window to my favorite talkers and muds with telnet to a unix shell account running tinyfuge, and have AtarICQ instant messaging running as well. Thanks to the CT2b, there is plenty of memory and speed for all this! It's also really nice to be able to open XOR and such at the same time as CAF...currently waiting for an SMP24 to try (wondering if other midi MROS aware apps will be able to see this under Geneva)...so in the meantime, I just have to use the Atari MIDI ports...still, better than nothing, and with a good MIDI patchbay...it's not so bad.

I've also done this in high color modes...but with a trade off of a much smaller display area. 800X600X256 worked fine, but gave me a slight headache because that particular resolution leaves my monitor with a pretty nasty flicker (yeah, I know with some time and paitence I can likely tune that fliker out...but oh well).

> 2. Works in a resolution other than ST Medium and ST High (i.e. is
> resolution-independent).

CAF/Score works fine in any resolultion. While CAF itself will still be only 2 colors...and sometimes switching tasks can leave easily tidied droppings on the desktop, it runs reguardless. Where you run into problems is trying to use the SCSI/Audio part of CAF with a high screen/color resolution. More than a few tracks over the SCSI, and there just isn't enough bandwidth across the bus (shared by SCSI/Video/and other things). A CT2b did wonders for me in this matter! Both SCSI and Video is vastly improved with a CT2. CT060 boards are due out soon!

> 3. Uses GDOS/NVDI vector fonts and printers.

Can't help you there :/
NVDI DOES help speed up CAF screen draws quite a bit thoe! I rarely boot without it. In fact, CT2b requires it (or fVDI which I've yet to try).

> 4. Is fairly comprehensive, like Cubase score.

I've yet to try it, but you might take a look at the score module that was intended to go with KCS Omega. It's free now, so can't hurt to try. Thoe you may be back to square one, or even more primitive on printer and resolution choices.
I don't know if there are plans to release source for this Score package, or relevant information to do your own drivers and such...but it's something you might explore.

> 5. Doesn't need to have MIDI compatibility, but that would be a plus.

Agreed...
Most are gonna support it thoe...it's already a very good format to save and load musical information with. Why reinvent the wheel?

> It also doesn't use vector fonts and newer printers, so it won't print directly to
> my printer.

What printer are you using?
HPCL5 is HPCL5, ESC2 is ESC2, etc...
Modern printers almost always understand one or the other of these. Newer Versions of HPCL or ESC tend to retain compatability with old drivers...I.E. they don't change old commands and paramaters/syntax...just add new ones. So, unless you have a very strange printer on your hands...there should be a driver with CAF that works.

See...in general...even/ESPECIALLY with modern printers and applications, the printer is simply called into a raster dump mode. The rest is just a matter of telling the printer what size/type paper, what special printer functions if any to enable, and so on.

Also...
300dpi is VERY good for font and notation print. Going higher than this for such an application is simply a waste of memory, cpu time, and printer port bandwidth. Those ultra high resolutions that modern printers support are intended for photorealistic work, and ummmm...marketing hype. I.E. printing halfway decent color photos done with personal digital cameras. Also...CAF can and does support as high a resolution GDOS font as you care to put in the fonts folder. It's just not worth it to go higher than 300...which is why you won't find many fonts higher than this.

Even today...pro image setters used for glossy magazines are known to do font work at 300dpi and less...news papers and paper back books even go as low as 72dpi.

So...in this case I suggest this...
Find a printer driver on your CAF disks that works...there's bound to be one!

I.E. If your printer is an Epson Stylus of any flavor, start trying all the Color Stylus drivers and work your way down. If it's an HP...try the HP drivers, Cannon, IBM, etc. You also might check your printer's owner manual to see if it has any 'emulation modes'. It's not uncommon at all for printers to be able to understand more than one PL. HPCL AND ESC2 for instance. If needed...slapping together a little auto folder program, or a batch file to initalize your printer into the emulation mode you want isn't hard at all. Again, all CAF is gonna do is send a command to put the printer in raster dump mode, tell it the resolution, paper size/type/tray, etc.

If all else fails...check out Ebay for an older Laser printer, or even go with a nice wide carriage inkjet so you can get into nice large paper sizes. Chances are you can find a VERY NICE one for chump change....a LOT less than shelling out for good score software on a PC or Mac alone!

I got Sibelius for my windows box...it's really nice! Supports the super high resolutions of the fancy new printers and all. Guess what? When you get down to the nuts and bolts of things, the scores it prints don't look any better than those done by CAF on my 300dpi laser printer. Again, going above 300dpi for monochrome print work is quite unecissary.

If you really need more fonts, someone out there is bound to have some nice GDOS bitmap font collections, or utilities to convert TT/PS2 fonts into GDOS bitmap.

> I have to print it to a file, then load it into either a image
> viewer capable of printing, or into Papyrus (which is what I usually end up
> doing). Both mean that once again, I have to switch OS's to get it printed.

I do this with Page Stream sometimes. Especially when I want to make music tests or texts. This way I can cut out bits of the image I need, paste them into a document, and even add new text, fonts, symbols, etc...thanks to the layering/object approach that Page Stream offers. If you get Geneva, you can do this and never skip a beat.

> It's extremely time consuming and frustrating. I also don't like the bitmap
> text fonts. I'd like to be able to use any font on my system, including
> vector fonts. And since my printer is very high-res, I'd like to be able to
> make use of that, by using vector fonts that aren't restricted to 360dpi.

I agree that it would be nice to have access to the nearly endless supply of TT/PS2 fonts. As for the high-res...again...it's a waste to go that high to print scores anyway. And printing from a falcon at 720dpi *yawns*, I hope you like coffee, or that your printer has megs and megs of onboard ram to cache up lines and lines of raster data, cause you'll have plenty of time to drink a few cups as you wait for the pages to print. Even at 360dpi, most inkjet type printers only have enough memory to hold about 1/4 of a page...so your Falcon is LOCKED UP untill the entire page gets dumped and printed (unless you can find some good printer spooler software for the Falcon, which I believe does indeed exist...but that's gonna steal lots of RAM).

Hope this helps,
Brian

Far as I can tell, the problem is that sound support is not yet implemented.

Yes, it does work...
You'll have to set it up by hand with a text editor.
See the readme files...
You'll either need an avserver with something like gemjing, or the STe/DMA bios extensions (for mint?).

Hi out there,

Is any one in need of an Atari Power Supply?

This is a true original ATARI Power Supply part number: CO17945.
Will work with the following Atari products: 400 / 800 / 810 / 822 /
850 / 1010 / 1020 / 1050 / XF551 / 1200XL.

go to http://cgi.ebay.com/ws/eBayISAPI.dll?viewItem&category=1250&item=1947220889

Auction ends 12/29/2002 @ 20:20 Pacific Standard time

Thank you.

They work, but only with MagiC or MiNT and the appropriate partition types, i.e. FAT32 or ext2fs. It is sufficient to simply change the partitoin ID to F32 in order to convert a "normal" partition to FAT32. The partition has to be initialized, wich can either be done with current versions of HDDRUTIL when partitioning or with special software that is available for MagiC or MiNT.

Sorry, of course I meant that it is *not* sufficient just to change the ID.

I replied to this message before, but I'm not sure if have hit the right button to post it to the newsgroup, so I'm trying again :-)

Music Edit is a promissing Atari program that is still being developed and ir runs also under MiNT/Magic/Geneva, is resolution independant, uses GDOS/NVDI vector fonts, and MIDI.

Music Edit deserves our support, especially because it's still being developed, but my favorite music Atari scoring program still is Score Perfect Pro. It only runs in monochrome, and under single TOS, but it simply gives the best results. I also have Cubase Audio Falcon, but for serious scoring it just isn't good enough. I mainly use CAF for sequencing.

If you want to try Music Edit take a look at http://www.musicedit.de

Hi Frank,

I think I have found the solution. I ran the mkfatfs utility from Mint tools on each of the >1Mbyte partitions. Once I had done this, the new partitions where accessible without even needing to re-boot.

I didn't realise that this step was necessary.

One oddity, THING doesn't report the correct partition size but Jinee does.

Regards,

Peter

Yes it does.

I couldn't work out how to go online with Highwire so I opened my
CAB hotlist and used the links from that.

Pages with cookies don't work of course but the few I visited looked
very good. If the jpg's worked I might start using it instead of CAB

4259. 24 displayed messages only problem

Newsgroup: comp.sys.atari.st
Date: 2002-12-27 15:31:35 UTC
From: John Hager <camarojohn@worldnet.att.net>
Message-ID: <rn_O9.14433$p_6.1222519@bgtnsc04-news.ops.worldnet.att.net>
Source record: 30219

I contacted my ISP. It seems, at least in his case, the new servers came with a default limit of 24 messages. They've got over 50k of newsgroups, far to many to go though and change the setting. They change this limit as people request it.

So, by the time I get home, the problem should be fixed. I guess if anyone else has this problem, they should check in with their ISP also.

> If you want to try Music Edit take a look at http://www.musicedit.de

Thank you to those who suggested this program. It looks like it will be a promising notation program, given a little more development. However, some problems...

First, it's in German, which I'm not too good at reading without sitting for hours with a German-English dictionary. This has made it extremely difficult to figure out.

Second, under Magic, it seems that it is having display problems. Anything the program draws in the display window is gigantic, out of proportion, and looks like when you "zoom" in about 20x on a paint program - great big blocks. And then, it crashes at the drop of a hat when I try to figure out how to fix it.

Third, while the display is better when used under normal TOS, it doesn't seem to like anything I do and gives me various messages in dialog boxes that I can't read. And when I get rid of the dialog boxes, the thing I wanted placed in the score isn't there.

Finally, I don't know how it looks when printed out, but the screen display looks really odd. The clef signs look like disproportionate stick figures, and the stems on the notes don't look like the right lengths. It really looks bad. But, like I said, maybe the actual printout looks right.

So, until there is an English version and it doesn't show any of these symptoms, I'll just have to stick with Cubase Audio, I guess. Unless someone has any other suggestions...

Thanks again!

I'm sure they're 50hz like the us (UK)... ahhh you're in America, right?
Well, don't worry - most will be 100% fine. Just a tad slower that's
all. 50/60hz was the norm on most pirate discs like Automation, Medway,
etc.etc.. so they'll all work
Dunno about they langeuage though! Or TOS version requirements..

Hello,

I can recommend you SPP (Score Perfect Professional), I use it daily for compositional and educational purposes and is imo much better and more comfortable to use than Cubase Score. It gives perfect printed scores and contains so many features. Very stable on every Atari. I use it under Tos and MagiC
It has all the features you want although I'm not sure about "3"
If you are interested : I have a demo of SPP 3.0 for Atari and SPP 3.1 for PC
I recently updated from full version 3.1 to 4.0 for Atari. I have the german and dutch versions but it is also available in english.
Cheers

I agree. Unfortunately 4.0 is the last (unofficial) version. The last
official version is 3.2. Future versions will not be available for Atari
anymore :-(

> I recently updated from full version 3.1 to 4.0 for Atari. I have the german
> and dutch versions but it is also available in english.

I have version 3.2 and 4.0 for Atari. But I'm having stability problems
with 4.0 on my Falcon030/CT2b. (Is it working stable on your system ?)
Therefore I'm using 3.2. Scores made with 4.0 can't be read by 3.x
versions. But I'm quite happy with version 3.2. And my CT2b turbo makes it
a pleasure to work with !

As far as the hertz display goes, most should work, but will not
be perfect. They were a number of ST games that had an option to
change the hertz display of the games. The authors there were
thinking ahead.

I think it's a bit unneccesary to write a conversion filter, since you can download a papyrus demo for pc. Read all your Atari files and convert them with Papyrus PC to Word/RTF/TXT/HTML docs.

Thanks! I've downloaded it right away. Now I only have to find a
PC that runs Windows, because the installer doesn't work with wine...
But this should be a great help.

4277. Ogg Vorbis with Aniplayer wirkt nicht

Newsgroup: comp.sys.atari.st
Date: 2002-12-28 14:23:03 UTC
From: "J.J.van de Gruiter" <jos_van_de_gruiter@hotmail.com>
Message-ID: <aukbosoge1@news2.tilbu1.nb.home.nl>
Source record: 30237

Hello Atarians,

I can't play Ogg Vorbis files with Aniplayer: I think I did everything right, placed the SLB-loader in the Autofolder, wrote the config.sys as described, placed the Aniplayer .slb files in the MagiC (6.2) extension folder. I can make MP2 files, so that works, but I still can't read .ogg files.

Has anyone succeeded in getting them working? I think Ogg Vorbis is a good alternativ for MP3, the files sound better and are (a little bit) smaller.

Cheers,

Jos van de Gruiter
http://www.9dayswonder.nl

Ken Springer <wordworks@greeleynet.com> wrote:
>Having read hear about ARAnyM, I've gotten interested in learning something about Linux.

:-)

>Long ago, I learned that it was a command line OS like DOS, but some work was being done

To begin with, Unix (of which Linux is one variant) is next to nothing
like DOS, fortunately. Unlike DOS, it actually _is_ an operating
system, where DOS is little but a program launcher and function library
(just like TOS).

Anyway, originally Unix was mainly used from the command line using
any of a number of command interpreters (shells). Since this was in
the early 1970's, there's nothing strange about that.

Of course, not everything is easily done with a text only interface,
so various graphical interfaces were implemented by workstation
manufacturers and universities. Since the mid 1980's or so, the dominant
one has been the X Window System. That's what you'll find, in various
variants, in just about all (non-embedded) Unix systems with a display
capable of graphics.

Note that X itself is not really a GUI. It only provides the facilities
to implement GUI's. On top of X you have for example GUI libraries like
Motif, Qt and Gtk, as well as desktop environments and window managers
like KDE, Gnome etc.

>on a graphical user interface. I have no idea where this all stands when it comes to the
>Atari platform. Is there a website that covers this?

While there are Unix variants that have been ported to the Atari machine
(there's Linux and at least one of the BSD's, and Atari themselves had
SystemV Release 4 ported, IIRC), you probably don't want to run those unless
you have a seriously upgraded machine.

>I've learned there are at least 2 "flavors" of Linux, GNU and Debian.

GNU (GNU's Not Unix) is a free (as in speech) software project to create
a complete non-proprietary operating system. You'll find lots of GNU
stuff in any Linux distribution, as well as probably in many of the
other Unix variants.

Debian is just one of the many available Linux distributions, which
uses lots and lots of GNU software just like the others.

> ARAnyM uses Debian,

My ARAnyM has never been anywhere near the Debian distribution, so
I'm not sure what you are referring to. Possibly some of the other
people who work on ARAnyM have Debian installed.

Anyway, which distribution you use should be completely irrelevant.

>in reading he ARAnyM site, but have signed up for their email list. Not much traffic, and
>what has been there has been "over my head". <G>

It's easier to get information if one asks for it. ;-)

>I think. My thoughts right now is to do this on my PC or Power Mac, possibly both. There

Since the ARAnyM JIT compiler only works on x86 CPU's, it will be a _lot_
(like perhaps dozens of times) faster at running Atari software on the
PC than the PowerMac (somewhat depending on what CPU's the machines
have, obviously).

>seems to be 3 major Linux versions, Lindows, Red Hat, and Mandrake. There may be more, I

I don't think Lindows even existed a year ago, so I wouldn't call it
major. RedHat and Mandrake are among the major ones, though, as are
SuSE (my favourite) and Debian.

>the group a question of ARAnyM and Lindows compatibility.

As long as you have the relevant libraries, the distribution is
completely irrelevant. And the libraries can always be installed
later if they are not included by default in whatever distribution you
chose.

I have tried it with MiNT/XaAES and it does work, but in a strange way.
I first encoded a little piece of music to OGG format using AniPlayer,
which took a little time - but it worked.

Then I tried to play the file and got an error message like "can't find
SLB" or something like that. I thought it didn't work at first. But then I
looked at Aniplayer's menu bar and saw a percentage progress indicator
counting slowly up from 0% to 100%. When this was completed, suddenly I
heard music coming out of my loudspeakers.

Try first with a small testpiece of music, and wait before you click
Aniplayer away.

Sure if you have a PC at 1GHz and a Mac at 100MHz, Aranym is a lot (like perhaps dozens of times) faster than MagiCMac ;-) Without serious tests you cannot compare this 2 JIT.

You need to install the 2 SLB for decoding and encoding Ogg Vorbis.
If MP2 encoding works, the latest version of Aniplay use the same way
for load the SLB (here VORB_ENC.SLB). If the line for save in Ogg Vorbis
is enabled the SLB is loaded. I see than the size of VORB_ENC.SLB is > 1
MB, but normally the system must return an error if the SLB can't be
loaded.

Preload sound was selected in the sound configuration box.
You can change this feature by set force D2D in the same box , but it's
possible than the SLB for decoding isn't enough faster. What is the
machine ?

> heard music coming out of my loudspeakers.

It's normal with this option.

Can anyone recommend a good C compiler for the Falcon? If
so where can it be purchased?

I'm not interested in a cross compiler under Linux on a PC.

If I install EasyMint along with some of the standard packages,
does that include a native gcc?

Thanks,

Sean

Hi All,
I've recently re-installed HDDriver 8.04 and Doom crashes although all else seems to be working ok (including much faster booting). No biggie to use ICD again for Doom but I was wondering if there is a setting in HDDriver I could change to make things more convenient. Note that this is on a Falcon running single TOS 4.04.
What do you think Uwe?

I'm using a Falcon030/CT2b. And even this is not fast enough for smooth playback. Does the decoder use Falcon's DSP ? The Falcon is fast enough to play MP3 files, even without the CT2b. Is decoding OGG files more difficult for a cpu than decoding MP3 ?

>
> > heard music coming out of my loudspeakers.

Somewhere on the ARAnyM site, I got the impression it was written for
Debian, but since I had no clue as to what Debian is/was/will be, I may have
gotten the wrong impression.

> Anyway, which distribution you use should be completely irrelevant.

This is true, I just expected a larger amount of messages. You also have to
have an idea of what you want to ask. :-) So I signed up for Mandrake's
and Red Hat's mailing list, and lots of traffice there. Some of my more
basic concerns were answered in the posted messages. After I gain a little
more knowledge of Linux basics, perhaps even trying it, I'll post the
questions I need answers for.

> have, obviously).

Mandrake at least has a PPC version, and I don't use the Mac for much except
surfing and chatting. That's because it's in the room with the stereo, so I
can listen to music in the background. It's pretty old and slow, so good
for chatting.

> > >seems to be 3 major Linux versions, Lindows, Red Hat, and Mandrake.
There may be more, I

>
> I don't think Lindows even existed a year ago, so I wouldn't call it

> SuSE (my favourite) and Debian.

IIRC, the Lindows site say they started up, or least organized, in 1998. A coworker heard about them on CNN, where they were talking about some really cheap PC's with Lindows installed built mainly for email and web related stuff. Sales were pretty brisk, and I've noticed that those cheap PC's are now unavailable or no longer listed. The more upscale ones are still there, tho'.

> difficult for a cpu than decoding MP3 ?

Today I think than Ogg Vorbis decoding is too large for the DSP memory
(program & tables).

> > > heard music coming out of my loudspeakers.
> >
> > It's normal with this option.
>
> I see. But the "error" message still is strange. The exact message I'm
> getting is "Could not open shared library vorbis.slb".

I remember than the program try to load different versions because for
exemple ivorbis isn't compatible with the normal vorbis library (FPU is
used). The ivorbis uses version 2 and vorbis version 1. Aniplayer try to
load the version 2 before, so if you have installed the FPU library
(version 1), maybe MiNT return this error after the fist call. I have
just tested under MagiC.

Regards,

Didier.

>Sure if you have a PC at 1GHz and a Mac at 100MHz, Aranym is a lot (like
>perhaps dozens of times) faster than MagiCMac ;-) Without serious tests
>you cannot compare this 2 JIT.

;-)

While that might be an interesting comparison to do, please note that
I was only talking about ARAnyM above. That was what the original
poster was going to install on a PC or a PowerMac.
So, the 'dozens of times' relates to ARAnyM running with JIT on a PC
versus ARAnyM running without JIT (the only possibility) on a Mac.
The former should be quite usable even on a rather slow PC, while
the latter is not likely to be very useful on most Macs.

It is quite possible that the current PowerMac 68k emulator is good.
However, MagiCMac costs money, won't run MiNT, etc.

Unfortunately, I don't have access to any Mac faster than an
80 MHz PPC601, nor any PC faster than a 1.3 GHz Athlon. So, I can't
do any actual comparisons between the PowerMac+MagiCMac and PC+ARAnyM
platforms for running Atari software.

Just to provide some information, comments about Logic 2.5

>1. Works in any Atari OS, not just the built in TOS/GEM.
Logic works under MagiC.

>2. Works in a resolution other than ST Medium and ST High (i.e. is
>resolution-independent).
Logic works in any mono resolution I tried. In color, there are some
"minor" display issues.

>3. Uses GDOS/NVDI vector fonts and printers.
This is where Logic is ruled out :)
Same as Cubase, GDOS bitmap fonts and editable "proprietary" drivers :(
Thus said, provided you manage to create a driver up to, let's say, 600
DPI, I think you can create GDOS bitmap fonts of 600 DPI, with a suitable
editor.

>4. Is fairly comprehensive, like Cubase score.
I've always heard that Notator/Logic is a little better on the score
side than Cubase.

>5. Doesn't need to have MIDI compatibility, but that would be a plus.
Logic sure does MIDI.

Just my 2 cents.

That's amazing!!!, I've got a random response parser, i fed in this thread
and it came up with the same response, identical down to the punctuation and
spelling mistake, the guy behind sinclap must be using the same random
string generator. I could generate my own sinclap responses.

Cool! I'm planning to try a set up like that, as soon as I get a
SCSI/Link T ethernet adaptor.

> I don't get color here, but I do have a nice large display to work with, and I

> (shared by SCSI/Video/and other things). A CT2b did wonders for me in this
> matter! Both SCSI and Video is vastly improved with a CT2. CT060 boards are
> due out soon!

Yeah, I love my CT2B, and am waiting for my CT60! Speaking of SCSI and
bandwidth, I'm lead to believe that a fast ide drive on a CT2B is a
good bit faster than the SCSI. If I understand it correctly, CAF was
limited to the SCSI because ide was often too slow in those days. Now,
I know I'm dreaming here, but if that restriction were removed, I
wonder if more tracks might be possible without compression. (Yes, I
know that Steinburg would have to fiddle with CAF, and that is
unlikely. Just a pipe dream!)

> Modern printers almost always understand one or the other of these. Newer

> with CAF that works.

Well, I have an Epson photo 700, and they must have changed something
when they went to the 6 color ink jets, because I've never found a CAF
printer driver that worked with it.

> those done by CAF on my 300dpi laser printer. Again, going above 300dpi for
> monochrome print work is quite unecissary.

Mostly that's true, except you can see a difference on slanted beams
and cresendo signs. But I'm happy with the output from CAF.

> LOCKED UP untill the entire page gets dumped and printed (unless you can find
> some good printer spooler software for the Falcon, which I believe does indeed

> exist...but that's gonna steal lots of RAM).

Gemspooler worked great with CAF on my stock Falcon, but when I tried it with my CT2B Falcon, it would lock up CAF as soon as it finished spooling and started to print. I wish I could solve that glich!

> Hope this helps,
> Brian

Once I get my SCSI/Link T ethernet adaptor, I hope you won't mind if I ask you for some advice setting it all up?

Wayne

4302. Teradesk V2.01 on XAAES

Source record: 30163

hi! I hope you remember me, Boris Cahan, AKA Telvt,the guy who wrote Telnet VT102. I have a bunch of Atari stuff, including a TT030 with 24 meg of RAM, that I want to dispose of to someone who is willing to pick it up. I think it would be a shame to throw it out. If you know anyone who might be interested, could you let them (or me) know and contact me? Or tell me where to post something? I don't want to pack anything myself, but have a lot of stuff, still.
I am in Cleveland, Ohio, and can be contacted at
bdc2@po.cwru.edu

4304. [UPD] January Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2002-12-30 10:11:02 UTC
From: Francois LE COAT <Francois.Le-Coat@lcpc.fr>
Message-ID: <3E101BB6.9090604@lcpc.fr>
Source record: 30164

Hi all, happy new year,

My software "Eureka" is updated and released on its WEB site.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka301.zip
That is the Complete Common Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny044.zip
Is the OpenGL Extension (requires previous package)

You must notice that OpenGL LDG TinyGL extension is updated.
This new release of Eureka requires TinyGL 0.44 to work
properly.

I wish you big fun with all this STuff !

Regards,

-- François LE COAT

Hi all!

On our website st-computer.net youÂ´ll find a new ressource-file for
the excellent midi-sequencer Sweet 16. The rsc gives the program an
improved 3d-look and more keyboard-commands under MagiC.

Sweet 16 runs fine with MagiC and graphic cards.

Check it out:
http://www.st-computer.net/software/

4306. AtarICQ 0.155 released

Newsgroup: comp.sys.atari.st
Date: 2002-12-30 17:08:03 UTC
From: GokMasE <fake@email.se>
Message-ID: <Usenet.rlrjgqtk@localhost>
Source record: 30166

Hi all,

In the eleventh hour of this year there is now a new version of the ICQ-clone for Atari GEM available. The most noticeable addition to the new version is the ability to keep messages in separate text buffers/channels.

In previous versions of AtarICQ, all messages have been coming into the same buffer, in some cases making it hard to keep track of who said what. Especially when talking to several people at a time)

Another thing you might notice, is that when a message is recieved from a contact marked as offline, this contact will be moved to the top of the offline contacts in list.

To download the new version and read about all the other changes in the program, please visit the AtarICQ homepage:

http://aicq.atari-users.net

Regards,

Joakim

4308. Sources for Free GEM updated

Newsgroup: comp.sys.atari.st
Date: 2002-12-30 18:21:53 UTC
From: GokMasE <fake@email.se>
Message-ID: <Usenet.qibojrhq@localhost>
Source record: 30168

Free GEM is a small utility (originally by Kellis) that is designed to present the current RAM statistics in a GEM window. The sources have recently been updated with the following changes:

* Only creating 1 window handle at a time
* Use of WIND_CALC to determine windows work area (Instead of assuming certain window border width) * Speeded up redraws of the RAM indicator (a lot) * Free GEM is now completely idle when window is shaded * Free GEM will now also detect real window shading, and enter the idle mode

The new sources+binaries can be downloaded from The Orphaned Projects Page:

http://topp.atari-users.net

-Maybe you're interested in maintaining future versions of this tool? (written in GFA basic)

Strange. I've never seen this problem on my system. Are you sure
cicons.rsc and desktop.rsc are there ? Can you start desktop.prg manually
from xaaes's "start" menu ? What exactly did you put in your xa_exec.scl
file ?

You mean: "buy"?
MagiC for Atari needs Atari hardware. If the emulator for Windows or Linux or whatever emulates the hardware of an Atari well enough, MagiC for Atari will run on it. MagiC for MacOS X has essential parts running in the native PPC environment, so it will not run on any other emulator.

Hello people...

I just acquired an SH205 hard disk which is split into 4 partitions. I want to repartition it to have one big partition, but each time I try to do it (with Atari utilities, v.5.0) I get a message about faulty structures, and a prompt to reformat. No matter how much I reformat, however, the same message appears. The formatting procedure does not show any problems, so I'm stuck... Any ideas?

Happy New Year everybody :)
Themis

How to Solve the lack of 3.5" DD Disks..

errm just a quickie but how about buying them from me.... both used and
brand new

Hi,

I am trying to install a rebootable ram disk.

Mark Williams C for the Atari ST, release 2.0
I click on rdy.prg, start going through dialogue.
But when I get to select logical drive, there are only 6 choices.
(C-H) which I already have assigned.

Rambaby allows a drive P: But it is not reset proof.
(I also have P assigned)

I have read of SI RAMdisk/Printer Buffer but I don't know if
it is rebootable.

Can anyone suggest a rebootable ram disk with higher logical drive
letters?

Thanks in advance.

Happy Holidays!

ken

There's RDE_5. It's based on RDY and can install on a drive letter upto
P: I know it works with an ST/STE, and testing on ARAnyM 0.6.8 shows it
should work on a Falcon.

If you can't find it on any of the Atari FTP sites, let me know and I'll
mail it to you. The archive is only 36.5k, 51.2k uue'd.

Regards,
David Bolt

I managed to get this to work. I converted to .MSA and then extracted them
via a windows based program. I am at home right now and forget the program
name (I am a travelling consultant whose Atari machine is what keeps me sane
during the week)

I can post the info when I get back to my *other* home Jan 6th

Hi All and Happy New Year!

There was a musical notation program called Proscore from Terence Kelly (I think) in the USA. I had the first version demo and tried to contact him to pay the required shareware fee for the full veriosn.

I have had no reply to my emails. The program was very good, but limited in the demo. Anyone comment?

Cheers,
Charles.
